WALTER SZREK'S
ANNOTATED COLLECTION

CALCU-LATING DEVICES

CALCU-LATING DEVICES

2024

Drawing by my granddaughter Sophia Szrek de Sousa Pereira, 9 years old.

Oh dear, how puzzling it all is!
I'll try if I know all the things I used to know.
Let me see:
four times five is twelve,
and four times six is thirteen,
and four times seven is – oh dear!
I shall never get to twenty at that rate!

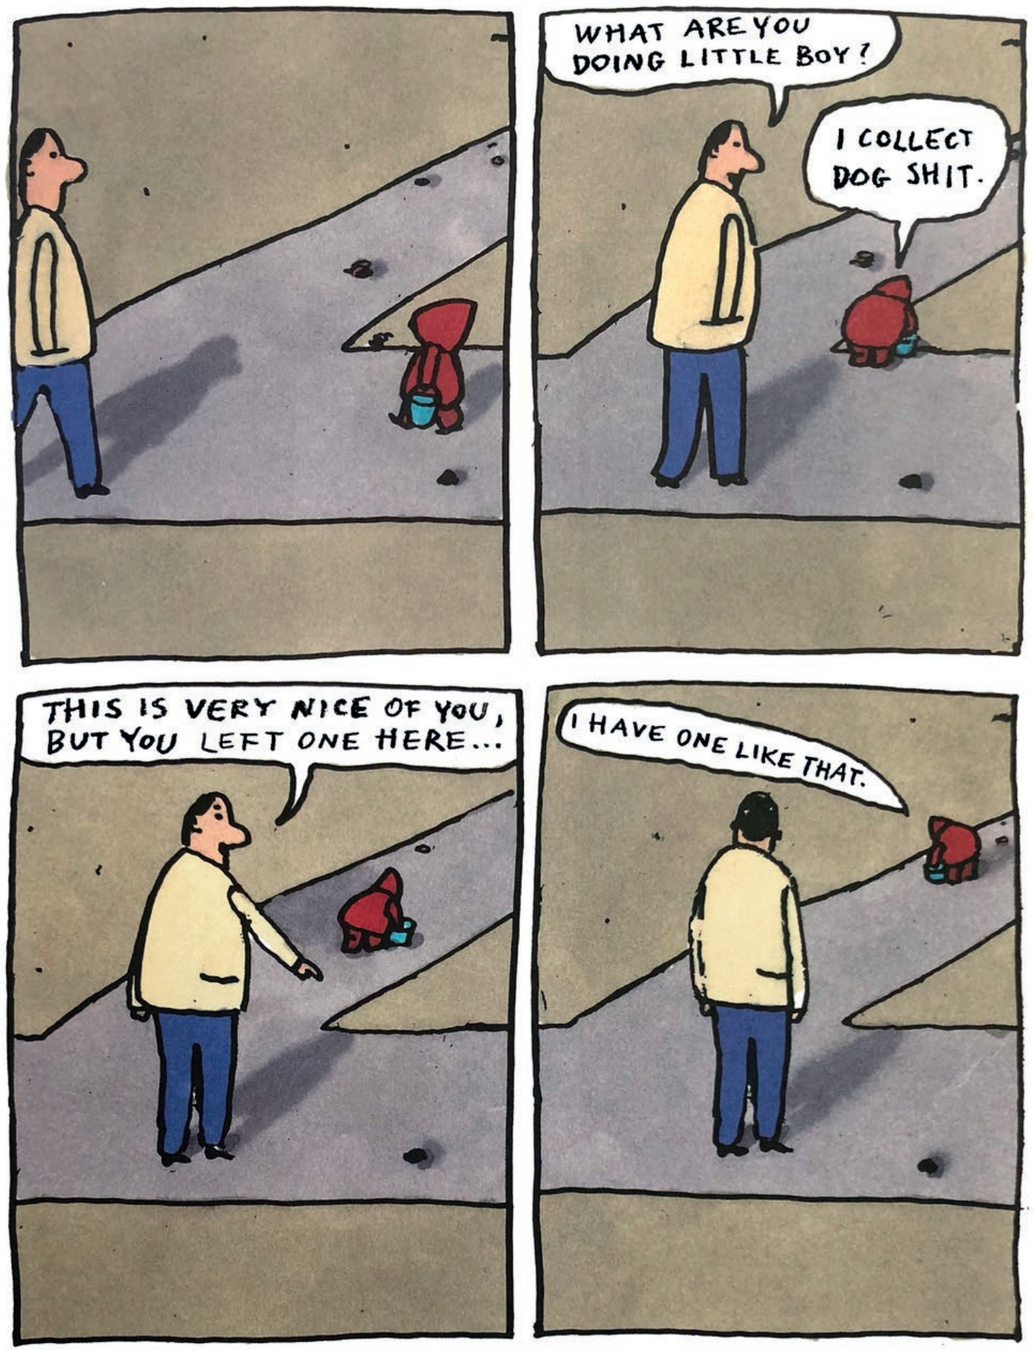
KUM'S DRILL-TEST



Created and drawn by Marek Raczkowski

INTRODUCTION TO "INTRODUCTION"

I got a year 2000 bug: I started collecting mechanical calculating devices in year 2000. I bought a Russian (Original) Odhner "A" from year 1907 at the antique flea market 'Kolo', in Warsaw, Poland. I fell in love with this machine. We were living in Warsaw for a few years as 'expats', many years after we emigrated from Poland to the United States.

And so it started… Over the years I was gathering a lot of different mostly calculating devices, but unlike some collectors, I was not able to get rid of any. As one of the collectors called my collection – it was a "black hole". Devices would get in, and they would never get out. Within my collection one can find a mixture: from very sophisticated and rare devices to simple and common ones. The process of collecting is also a process of learning. At the beginning you collect what you like. Later, you also collect what you like but what changes is that you learned a lot and may get to like different things. I happen to like all the devices in my collection. There is something special about each of them.

Collecting brought to my life a few very special people with whom I became friends. Especially Mr. Tadeusz Kabzinski, Herbert Schneemann and Valéry Monnier. Mr. Kabzinski originally repaired my machines. He passed to me his love and passion of these devices. Unfortunately, he did not pass any of his skills.

I spent a lot of time with Herbert. We both worked (mostly him) on the website www.Rechenmaschinen-Illustrated.com. We spent a lot of quality time discussing these devices and also life, politics, etc.

Valéry is my special friend. He is a genius and an artist. Each time we chat over Skype, I learn something. Valéry taught me how to recognize things that are unique and interesting. I also got from him a few of the most interesting devices I own. Our work together on Slonimski's devices taught me a lot. Together with Valéry and Janusz Zalewski we wrote an article about Slonimski's adding devices: Chaim Slonimski and his adding devices, published in ACM magazine. Valéry created two great web sites: Arithmetical machines and instruments, 19th century (ami19.org) and www.arithmometre.org. Valéry also created beautiful replicas of different devices. I own a few of these replicas. Mr. Kabzinski passed away in 2003. Herbert in 2014.

ME AND COLLECTING

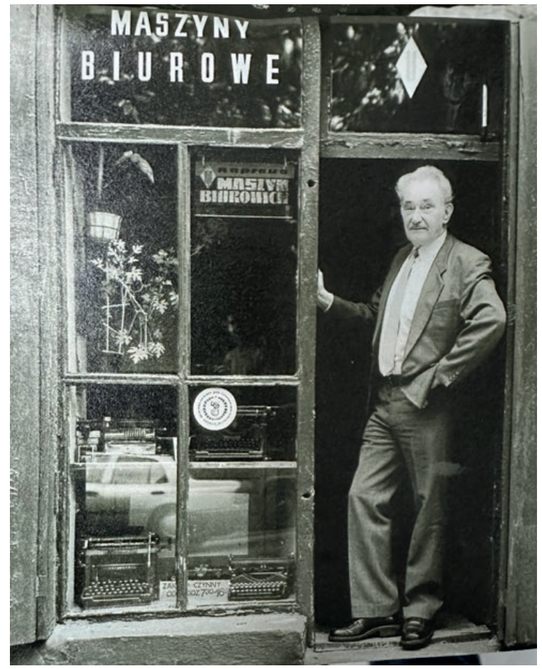
I think many collectors are "addicts" as collecting is an addiction. One can smoke, collect books, collect paintings, drink, etc. I am one of these addicts. I have collected different things most of my life. I have this inability to get rid of any of these items. First, as a student, I started collecting Polish posters. Now, close to 1,000 beautiful posters have found their place under a bed in our house, some hang in the hallway. They are not alone there. A nice Michelin lamp and a few Michelin signs found their place there, too. Both poster and Michelin collections are 'under control' now – They do not grow any more.

Same with my beer bottle opener collection. It is peacefully confined in 7 big boxes in the cellar downstairs. Just a few of them are here and there waiting for their proper use.

CREDITS

I want to thank a few very special people for contributing to this catalogue:

- Professor Ewa Wyka, who enabled the collection to remain intact at Collegium Maius Muzeum of Jagiellonian University (Muzeum Uniwersytetu Jagiellońskiego Collegium Maius), one of the oldest Universities in Europe.
- My wife Irena and daughters Asia, Helena and Monika, without whom the collection would never have been created.
- Mr. Kabzinski, Herbert Schneemann, and Valery Monnier, my best 'collecting friends' from whom I learned a lot,
- Two Piotrs: Strzalkowski i Kaczmarek, who shared their thoughts on yet another version of the catalogue.
- Marta Gierych, who created a beautiful printed version of my original catalogue.



Mr. Kabzinski in front of his office and machines repair shop, in Praga neighborhood in Warsaw.

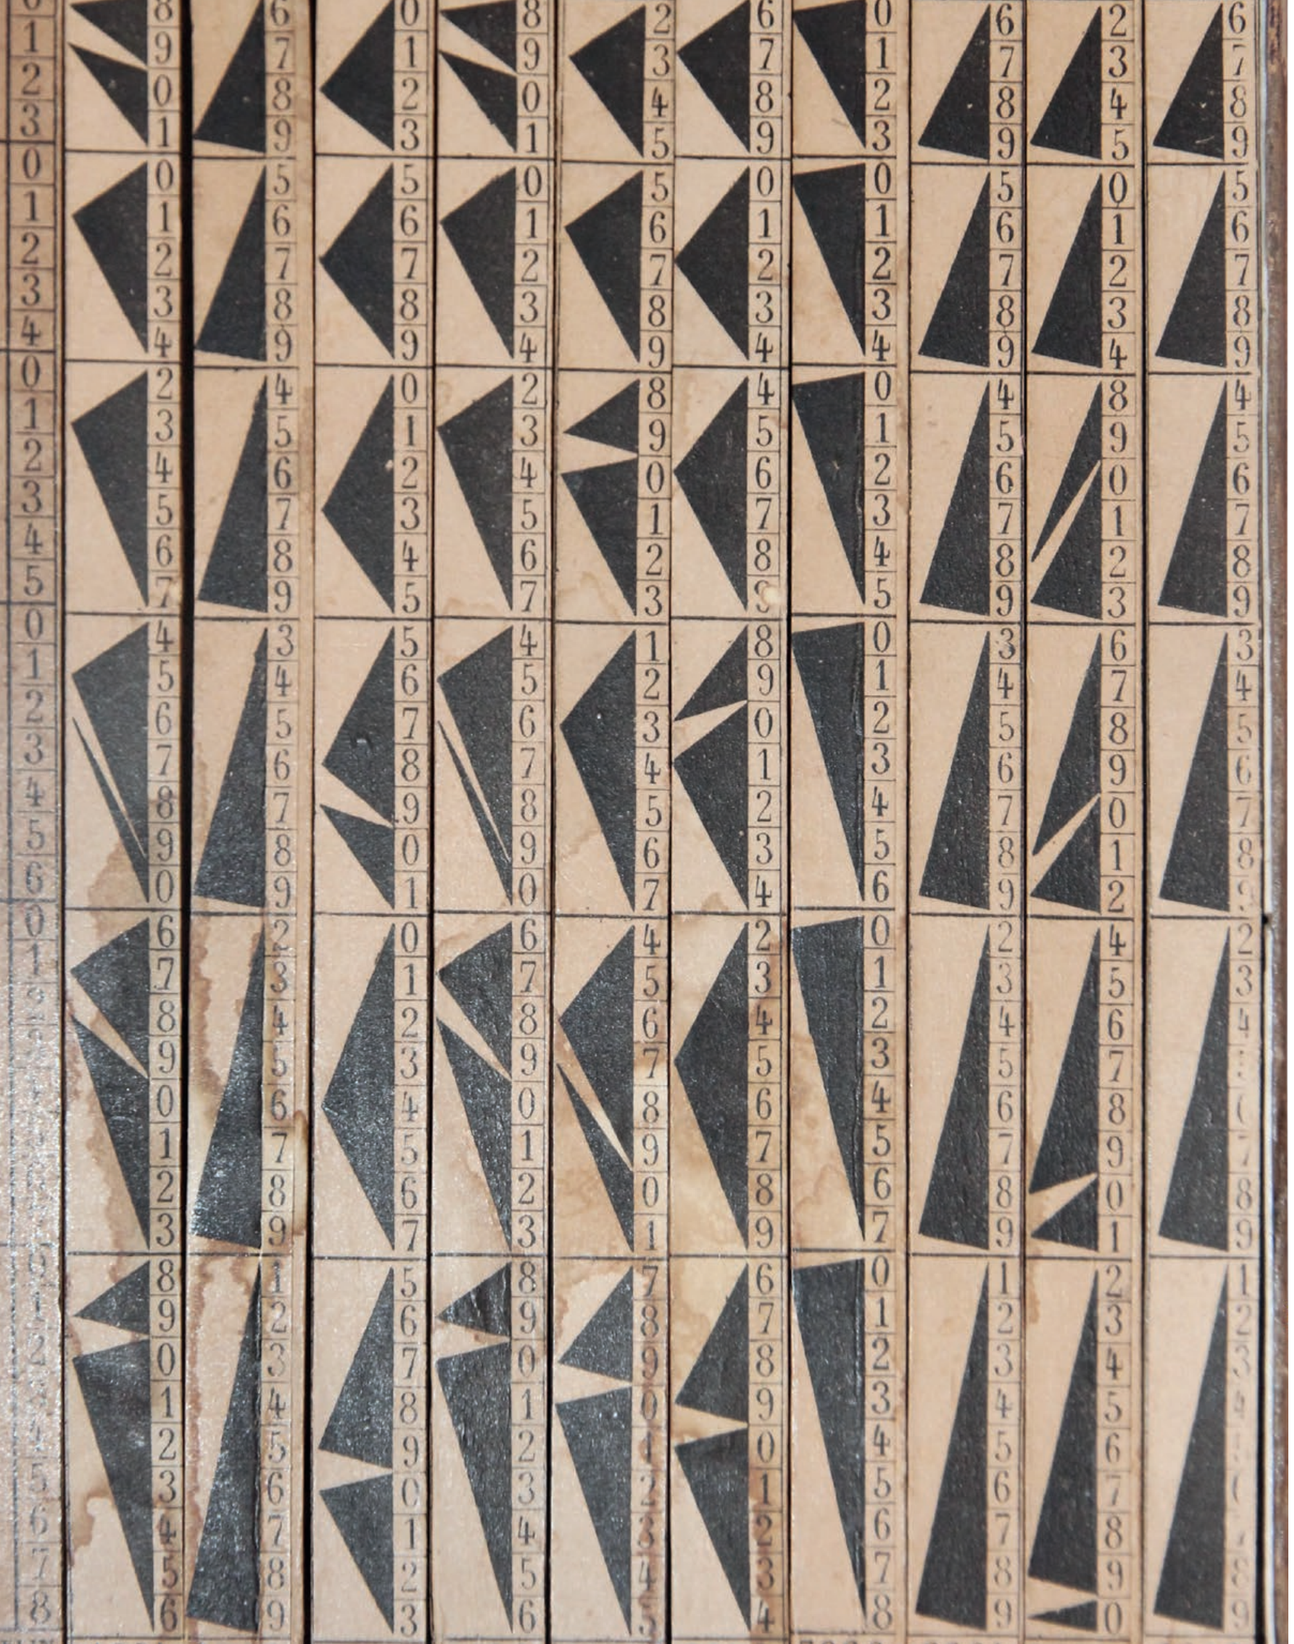
ORGANIZATION OF THIS <^v> CATALOGUE



This catalogue consists of several sections:

- **Introduction**
- **Interesting links** to "calculating sites" and credits to some places where I learned about calculators
- **Highlights** – a snapshot into some of the most interesting devices and other artifacts from the collection
- **Rooms** – pictures of the devices grouped by calculating criteria. Rooms are designed to contain almost all the pictures for this specific class, and to link to the detailed catalogue section for their class.
- **Details** – detailed catalogue of almost all artifacts in the collection. This is the actual catalogue of all the devices.
- **Papers** – highlights of the paper collection (mostly related to calculating machines).

Classification

I sometimes classify a machine in the "wrong" category, as it should often belong to a different category or be a category of its own. Good examples are Millionaire and Mercedes Euklid, that are not step drum machines but were included together with step drum machines. It is difficult to be right with classification when a device is rare or very rare. There are no sources that one may rely on. I used my best judgment. Often, I would either leave this space empty or categorize the device in two categories, e.g., rare / very rare. The same with the production year. I relied on different sources to set the year. Where I knew the date, I would have used an actual production year, not when the machine was first introduced to production. Sometimes, I put an approximate year if the actual year was not known, and I could approximate it. I marked the devices according to their name, production year (this gave some chronological spin to the collection) and by rarity.

Rarity

When a device is depicted as very rare, it means that the device comes to the market once in several years. If the device is rare, it comes to the market a few times within a year or two. Unique device means only one example is known. To confirm it, I verified the sources easily available such as Rechnerlexikon, Rechenmaschinen-Illustrated, some other specialized sites and Google search. One known means to the best of my knowledge it is the only one existing, so it does mean that these machines are extremely rare and possibly the only ones existing. This categorization is very subjective and is only based on my knowledge and experience.

Historical significance

Stars (*) are used to mark devices as historical. When the device is depicted as historically important, this means that this device had an impact on the development of the industry, or the method calculations are done. One should not confuse rarity and historical importance. Devices can be rare, but not of historical significance, e.g. only a few manufactured and never continued. In addition, such devices have not introduced anything special or any new methods in the way calculations are done.

Device vs. machine

The word device is used to depict devices that do not mechanically enforce carry, e.g., abacuses, Fowler adders, Slonimski Adder, Slonimski Multiplier, Genaille-Lucas, Addiators, von Funke Adder. etc. The word machine is used where carry is enforced mechanically: pin wheel machines, step drum machines etc. Device in plural form (devices) is used to depict both machine and device.

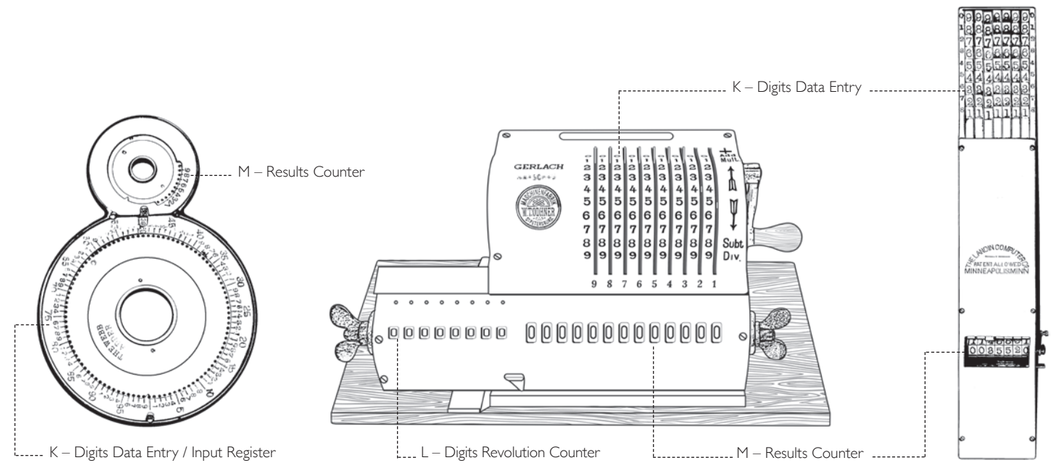
Arithmometer

The word arithmometer is used for step drum machines and for the machines that specifically have arithmometer in their name e.g., Odhner Arithmometer.

Precision

Multiplying devices precision is described as K × L × M, i.e., K – digits data entry (setting sliders or columns of keys), L – digits revolution counter, and M – digits result counter. E.g., Curta I (8 × 6 × 11) has eight digits for data entry (known as "setting sliders"), a six-digit revolution counter, and an eleven-digit results counter. Very early Thomas Arithmometers did not have the revolution counter register (L).

Adding devices precision is described as K × M., i.e., K digit of data entry (setting sliders/keys) and M results., e.g., Landin Computer (7 × 7) is 7 for data entry (setting sliders) and 7 digits for result.

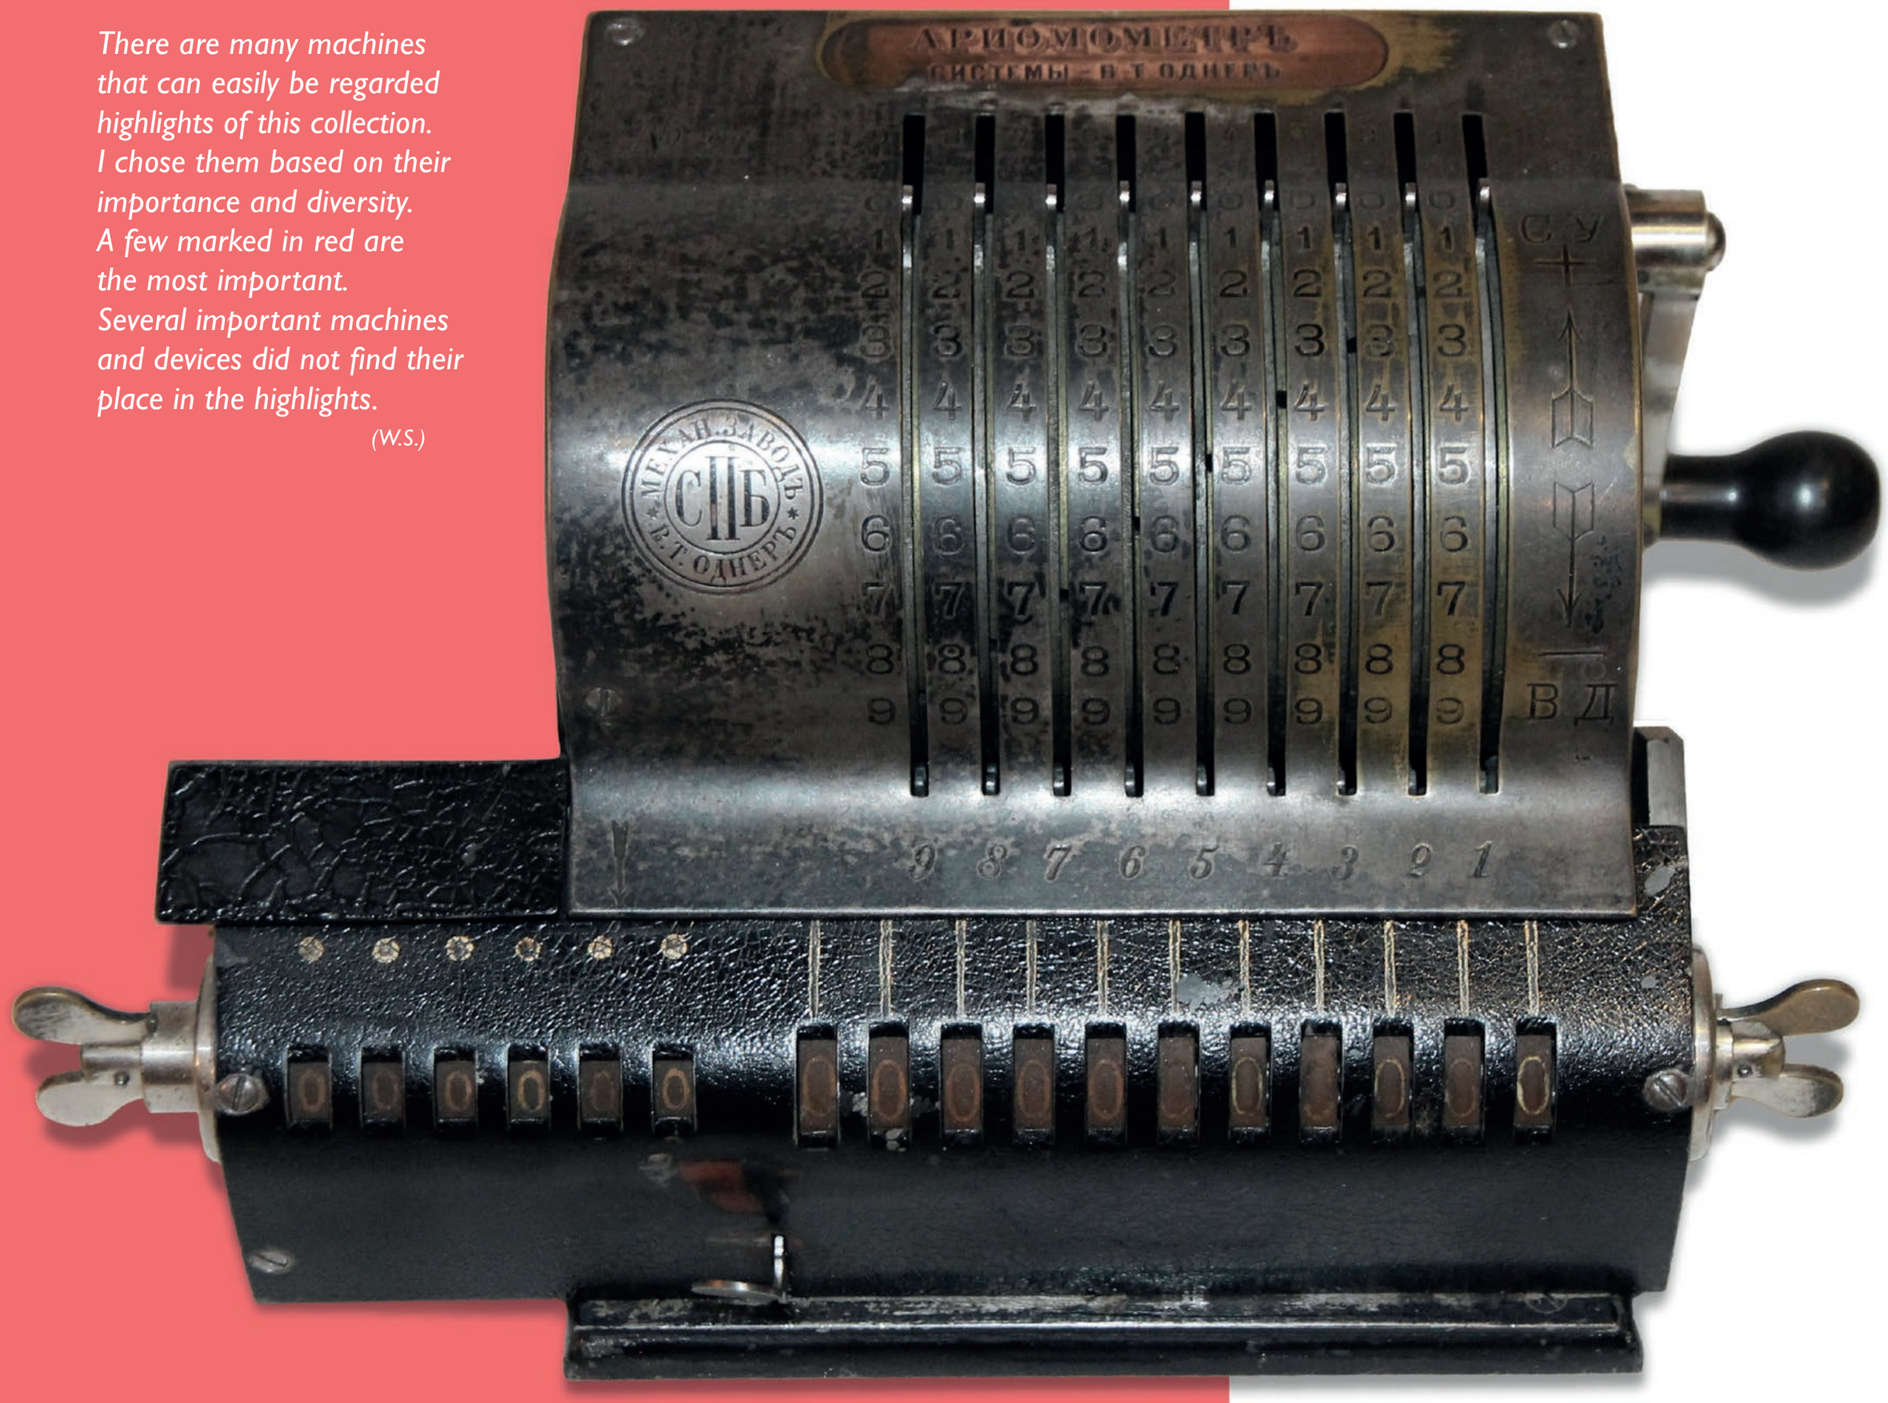


3

>HIGH-
LIGHTS

There are many machines that can easily be regarded highlights of this collection. I chose them based on their importance and diversity. A few marked in red are the most important. Several important machines and devices did not find their place in the highlights.

(W.S.)



*****

ODHNER 21

Russia, 1890

The most important machine in the collection. The first known production Odhner, Serial 21 (Russia, 1890). Wilgodt T. Odhner invented this type of calculating machines. The machine supports all basic arithmetic operations (+ - × /). This is a so-called short handle model. In 1897 Odhner replaced a short handle (on the right) with a longer one, as some users were injured operating the machine. There are four more short handle Odhners in the collection. In XX C Odhner type machines became the most popular calculating machines.

WS-267

I.F.H.B. HISTORISCHE
Bürowelt Nr. 104, July 2016
Odhner – serial number 21

Until now, the Odhner calculator with the serial number 52 was regarded as the oldest known. This machine is in a museum in Stockholm. In April 2016 Walter Szrek (Rhode Island, USA) succeeded to bid an even older machine in Sweden. She has the number 21, she has a crank handle made of plastic, probably ebonite (a hard rubber that is also used for piano keys and pipe mouthpieces and clarinets). Price according to the internet portal: over €10,000.

W. Szrek is co-editor of "Rechenmaschinen-Illustrated.com", together with H. Schneemann (1941–2014)

*****

1 NAPIER BONES

Scotland, early XVIII Century

Multiplication of any number 1- 9. Multiplicand selected using rods. Mental addition of carries. Roth (France 1844) simplified mental adding. Slonimski (Russia 1844) eliminates mental adding requires choosing the next "rod". Genaille-Lucas provides a graphical solution without mental adding and next rod manipulation.

WS-173

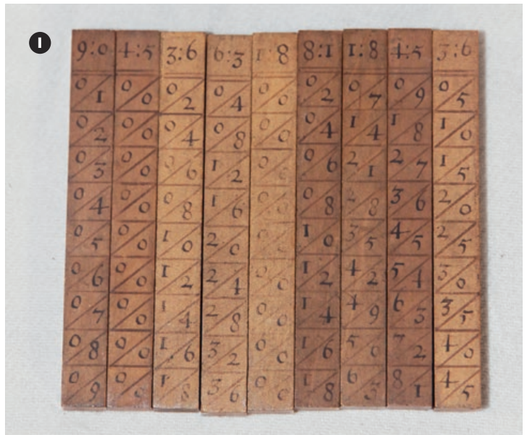
*****

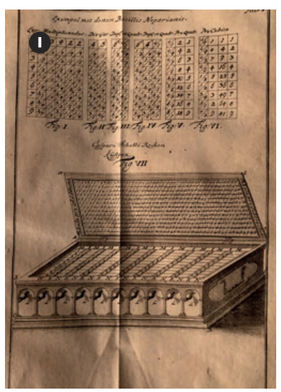
2 NAPIER BONES

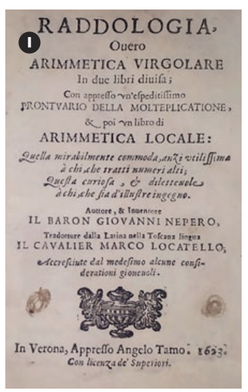
Scotland, early XVIII Century

Early multiplying device.

WS-174







*****

3 ARITHMOMETER THOMAS DE COLMAR

France, 1852

2nd most important machine in the collection. Thomas de Colmar Arithmometer, serial 164. One of the first arithmometers (France, 1852). First commercial device to support all arithmetical operations. Very early Thomas machines did not have a counter register (the register on the bottom of the movable carriage). Thomas machines enabled understanding the need for using calculating machines. This was fundamental in the creation of the calculating machines industry. After Thomas' patents expired, arithmometers were manufactured in several countries.

WS-222

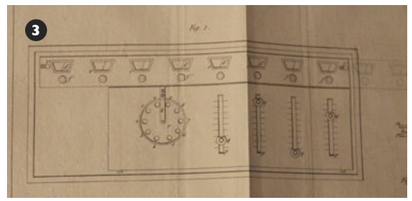
****

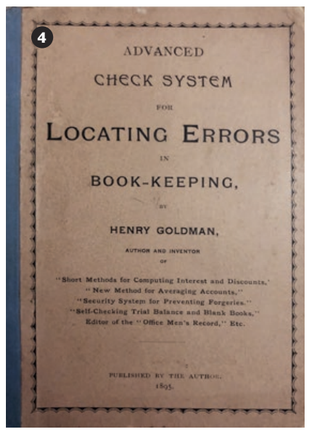
4 ARITHMOMETER THOMAS DE COLMAR EXPERIMENTAL

France, 1880-1890

Thomas de Colmar experimental Arithmometer with multiplier (1880-1890). Never went into production. Only two made. One known to survive. With multiplier (right bottom corner). Instead of rotating the handle 7 times, just move the multiplier to position 7.

WS-224





*****

1 ARITHMACHINE

Germany, 1899

Goldman's Arithmachine (US, 1899) adding machine. Sliding bars adding machine. Later Goldman introduced Contostyle (Germany, 1906) and back in NY Arithstyle. Precursor of several other machines such as Argos, Behr etc

WS-28

*****

2 LANDIN COMPUTER

US, 1891

Landin Computer adding machine (US, 1891). First commercial sliding bars adding machine. The only one known. Precursor of many different machines of this type such as Rapid Computer, Comptator, Surot/Addi/BuG, SuN, Multo, …

WS-1

*****

3 BRUNSVIGA B

Germany, 1894

Brunsviga B serial 364 (1894). Brunsviga licensed Odhner patents and started manufacturing Odhner type machines in Germany in 1894. After original Odhner patents expired, Odhner type machines were manufactured in many countries. Only 24 early Brunsviga models are known to survive. Initially Brunsvigas had a short handle which was soon (1895) replaced by a longer one, as users were often hurting themselves.

WS-741

*****

4 BRUNSVIGA C

Germany, 1896

Brunsviga C serial 1453 (1896). Very rare low-cost model. Little hand on the top is a Schuster logo, reseller of Brunsviga machines in Berlin. The machines with "Schuster hands" are very rare and sought after by collectors. This machine has short handle same as original Brunsviga B. After initial few machines, another model "C" (C-2) with a longer, still short, handle was introduced.

WS-740

***

5 FOWLER

US, 1863

Fowler adding device. Very early US commercial device to simplify adding. Sliding bars allow adding and indicate carry. Results on the back. In 1890 Fowler introduced an improved version – Universal adder. Precursor of the Locke and Bamberger Universal adders.

WS-142

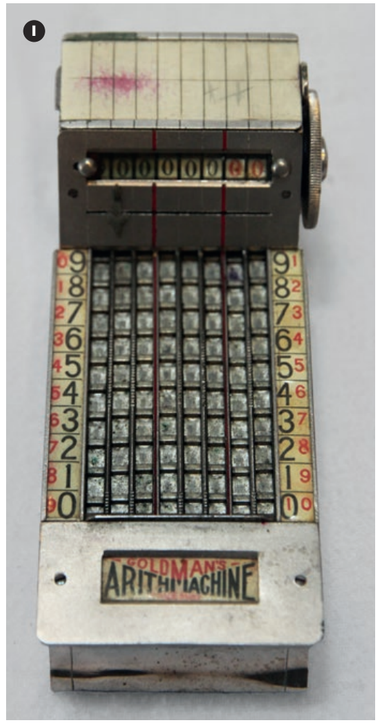
*****

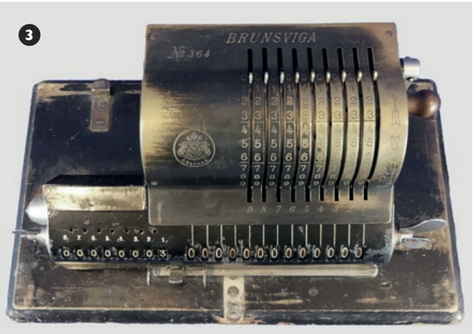
6 BURKHARDT ARITHMOMETER 72

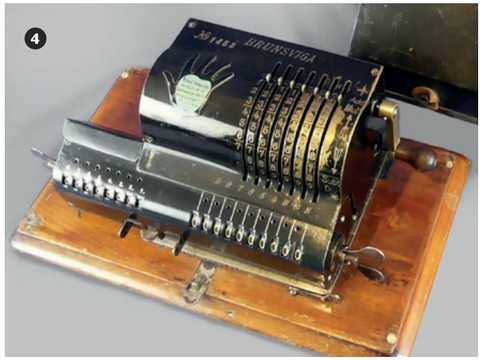
Germany, 1878-1879

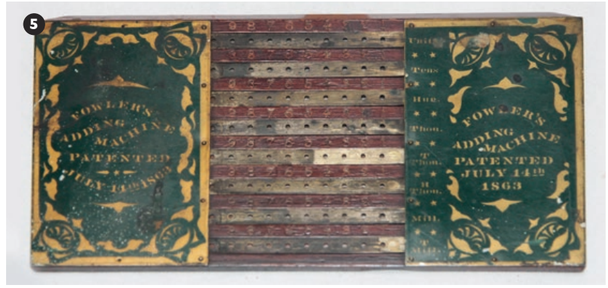
Very early Burkhardt arithmometer serial 72. One of the first Thomas type machines manufactured in Germany. Arthur Burkhardt improved Thomas' design and started manufacturing Arithmometers.
Burkhardt is regarded a father of calculating industry in Germany.

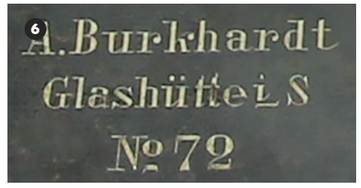
WS-236

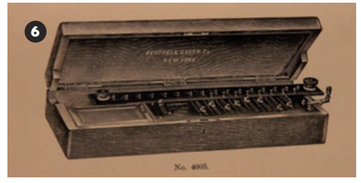


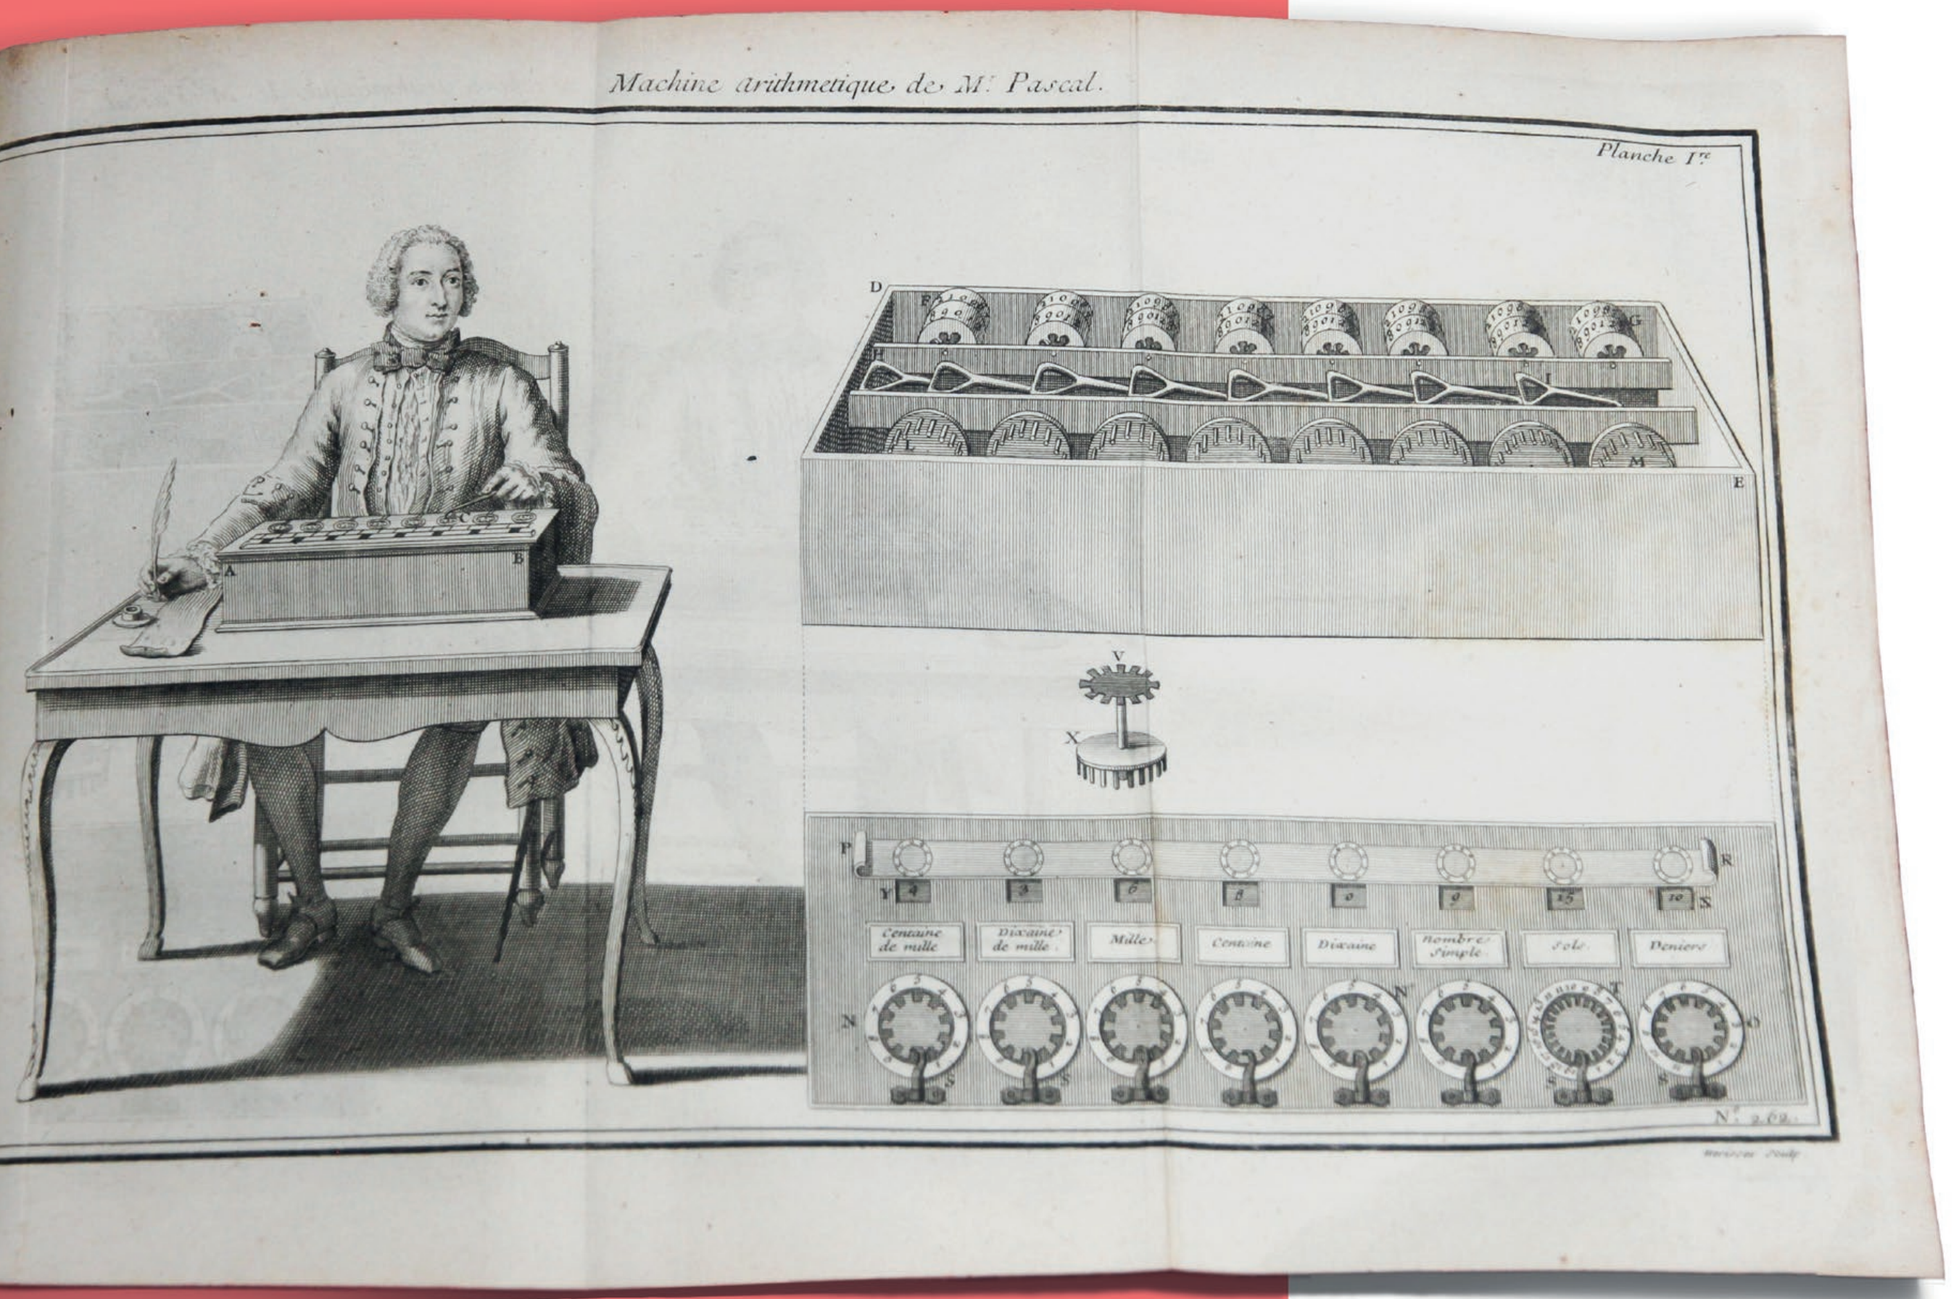










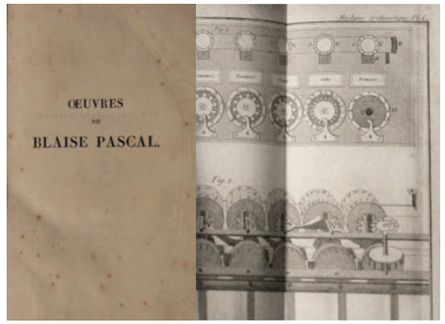


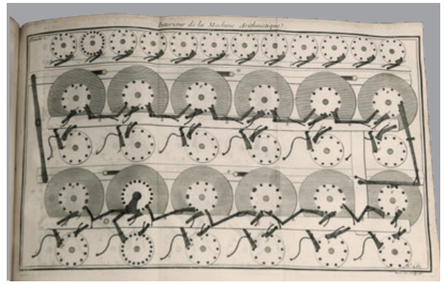
*****

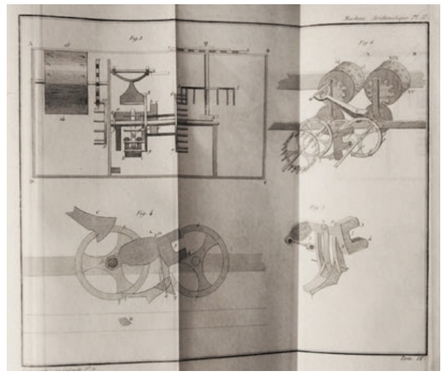
OEUVRES DE BLAISE PASCAL

France, year?

Pascal's adding machine from Gallon's (1735 & 1760), complete all 7 volumes with French inventions till this time, with over 500 inventions, each with description and beautiful engravings.







*****

1 9 DIGIT ROTH

France, 1842

9-digit Roth adder for Indian money.
David Roth's adders were the first adding machines manufactured in a quantity more than a few since Pascal made 50 Pascalines 200 years earlier. The only Roth device known to support Indian currency.
This is also the first known device to support Indian currency.
Small quantity of Roth adders was manufactured. Nine- and two-digit Roth adders are extremely rare.
Probably less than 100 Roth Adders were manufactured.

WS-36

*****

2 2 DIGIT ROTH

France, 1842

2 Digit Roth Adder

WS-37

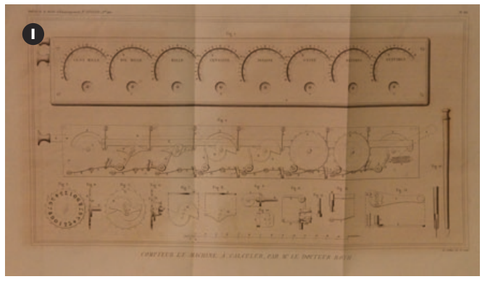
*****

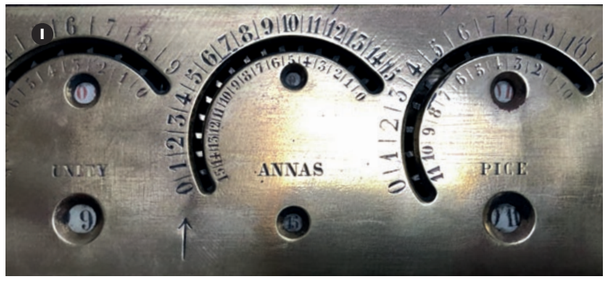
3 2 DIGIT ROTH

UK, 1860

2 Digit Roth Adder

WS-38





****

4 FILIPOWSKI

UK, 1860

Hershell Filipowski multiplying device. Based on Slonimski's mathematical theorem: for all multipliers [0, 9], regardless of the state of carryovers, there are 28 states of carryovers. To multiply, neither mechanical carry nor mental addition is needed. Filipowski's device has 56 rods, each representing 1 of 28 states of carryovers. During multiplication both multiplication result and a rod corresponding to the next digit position (state) is determined. Only one other, in Science Museum in London, is known.

WS-180

***

5 ARITHMOGRAPH DUBOIS

France, 1866

Very interesting and rare multiplying device based on Napier bones principle.

WS-646

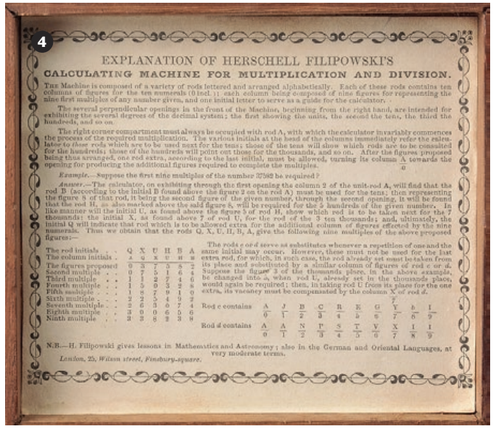
*****

6 CHAPIN ADDER

US, 1870

G.W. Chapin Adder. The first adder of this type manufactured in US. The only one known.

WS-201



*****

BALDWIN ARITHMOMETER

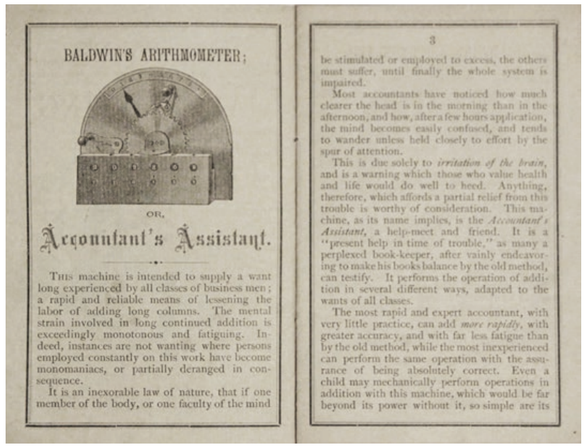
US, 1874

Baldwin Arithmometer. Very rare adding machine by Frank Baldwin, one of the creators of calculating machines industry in US.

In October 1872, I married Mary K. Denniston of Williamsport, Pennsylvania, who was visiting relatives in St. Louis. The year after, we moved to Philadelphia where I rented a small shop and started to make ten of the calculating machines. While thus engaged, I saw the expediency of a small machine to supplement the larger one, and designed an adding machine which I named the 'Arithmometer,' and this patent, dated July 28, 1874, was the first one of the kind granted me by the United States Patent Office. It was also one of the first adding machines sold in the United States.

I placed both machines on exhibition at the Franklin Institute, Philadelphia, and was awarded the John Scott Medal for the most meritorious invention of the year… The Government granted me patent rights in 1875.

WS-607



BALDWIN'S ARITHMOMETER;

OR,

Accountant's Assistant.

THIS machine is intended to supply a want long experienced by all classes of business men; a rapid and reliable means of lessening the labor of adding long columns. The mental strain involved in long continued addition is exceedingly monotonous and fatiguing. Indeed, instances are not wanting where persons employed constantly on this work have become monomaniacs, or partially deranged in consequence.

It is an inexorable law of nature, that if one member of the body, or one faculty of the mind be stimulated or employed to excess, the others must suffer, until finally the whole system is impaired.

Most accountants have noticed how much clearer the head is in the morning than in the afternoon, and how, after a few hours application, the mind becomes easily confused, and tends to wander unless held closely to effort by the spur of attention.

This is due solely to *irritation of the brain*, and is a warning which those who value health and life would do well to heed. Anything, therefore, which affords a partial relief from this trouble is worthy of consideration. This machine, as its name implies, is the *Accountant's Assistant*, a help-meet and friend. It is a "present help in time of trouble," as many a perplexed book-keeper, after vainly endeavoring to make his books balance by the old method, can testify. It performs the operation of addition in several different ways, adapted to the wants of all classes.

The most rapid and expert accountant, with very little practice, can add *more rapidly*, with greater accuracy, and with far less fatigue than by the old method, while the most inexperienced can perform the same operation with the assurance of being absolutely correct. Even a child may mechanically perform operations in addition with this machine, which would be far beyond its power without it, so simple are its

1 ELLIOTT BROTHERS

United Kingdom, 1882

The first UK Arithmometer, very rare. Elliott Brothers were manufacturers of scientific instruments in XIX and XX Century in London.
"Essential as the arithmometer was becoming to the Prudential's business, the machine could not be treated as a fully reliable resource. The company's archives preserve a few fragmentary but revealing records of repair work carried out on their arithmometers during the 1870s. Springs would snap and other more serious mechanical defects were not uncommon. The effort of the quinquennial valuation severely tested the machines' robustness: in one month alone in 1877 12 machines required attention for one or more repairs. To guard against the dangers of both operator and mechanical error, the Prudential typically carried out its calculations in parallel, using one machine to check the results of another. But the company was so concerned with guaranteeing reliability that it sponsored the development of an English version of the arithmometer in the hope of obtaining improved performance. An 1879 letter to The Times *announced 'a premium of £300 in addition to the full price of 20 perfect English-made machines'. When the prize was paid in January 1882, £200 went to the instrument makers Elliott Brothers."*

Stephen Johnston (1997)

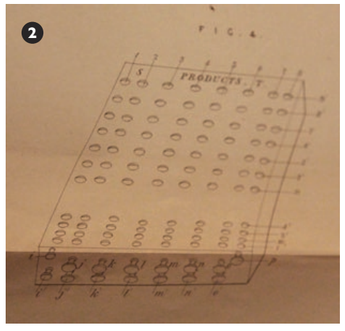
WS-527

2 SLONIMSKI MULTIPLICATION DEVICE

Poland, 1844 (recreation France, 2009)

Recreation of 1844 Slonimski's multiplying device by Valéry Monnier (France, 2009). Slonimski created the first multiplication device without mechanical carry or adding carry in memory (1844). None of Slonimski's devices survived. Filipowski's multiplication device, above, differently implements Slonimki's theory.

WS-650



*****

3 ARCHIMEDES JUNIOR

Germany, 1925

Two miniature arithmometers: Archimedes F Junior (Germany 1925) and Curta I (Lichtenstein 1949).
Junior weights 8.8 pounds and is 21 × 16 × 6 cm.
Precision: 6 × 6 × 10. Junior was quite heavy and bulky.
It had also a limited precision. Not many were manufactured.

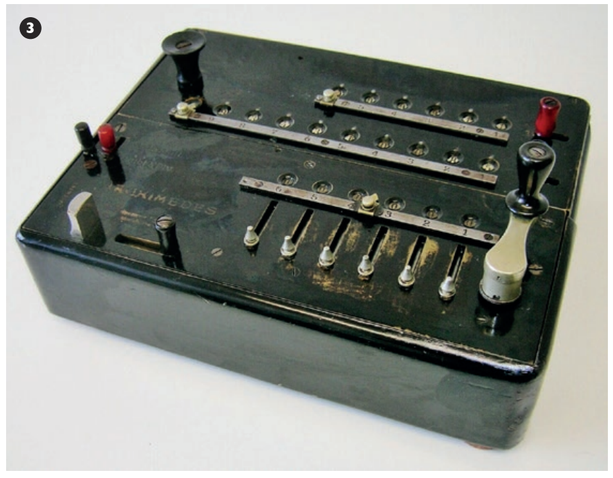
WS-753

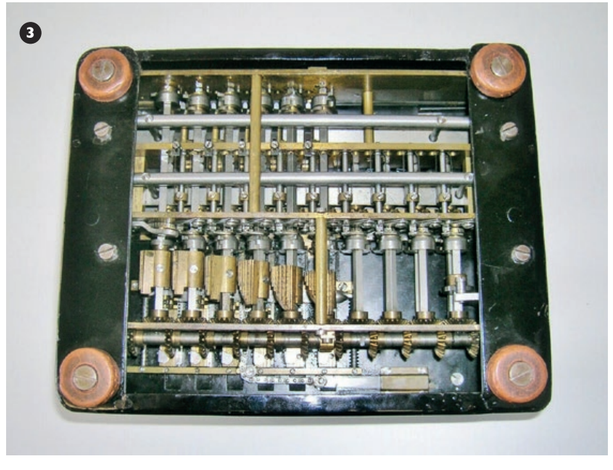
4 CURTA I

Lichenstein, 1949

Curta I weighs 0.75 pounds and 13 × 7 × 7 cm. Curtas were small, light, and very convenient to use. Over 140,000 were manufactured: 80,000 Curta I and 60,000 Curta II. Precision: 8 × 6 × 11.

WS-238





*

1 KULI

Germany, 1909

The most advanced column adder from maker of Adix. It is also much bigger. Traditional Adix is a small pocket column adder. This device allows to remember carry between columns and simplifies adding columns. This is done at the price of bulkiness. It is no longer a pocket adding device. Because of this, and much higher price not many Kuli adders were manufactured.

WS-130

*

2 ABACUS (JAPAN)

Japan (?), XIX century (?)

Abacus (Japan (?), XIX C (?)). Valéry Monnier thinks the Japanese (?) abacus might have been used as a game counter.

WS-436

*

3 SMALL BONE RUSSIAN SCHOTY

Russia, XIX century

Such small abacuses could be kept in a pocket or the purse.
A very small bone Russian schoty.
Another small abacus in the photograph below (Poland).

WS-437

****

4 SPALDING

US, 1884

Very early and interesting column adder. User adds multiple numbers by adding numbers in each column consecutively.

WS-623

*****

5 COMPTOMETER

US, 1887

Very rare, first model of one the most important US calculating machines. Comptometers (constantly improved) were manufactured till 1970s. They were very reliable and fast to operate. The first electronic calculators Anita Mark VII and Anita Mark VIII came from the Sumlock Comptometer Corp.

WS-657

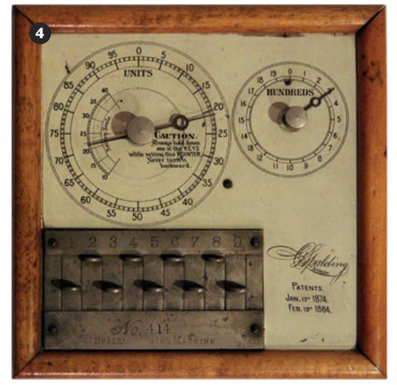
****

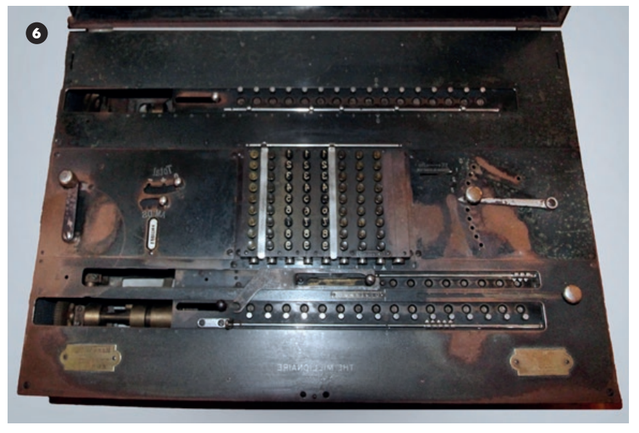
6 MILLIONAIRE

Switzerland, 1918

Millionaire with Totalizator. Millionaire was the first commercially successful machine with direct multiplication. This machine is very rare, it has an additional totalizator (on top). It is also non-electric. Only few machines were equipped with totalizator. 38 machines of this model were manufactured (non-electric, with Totalizator). Two are known.

WS-660





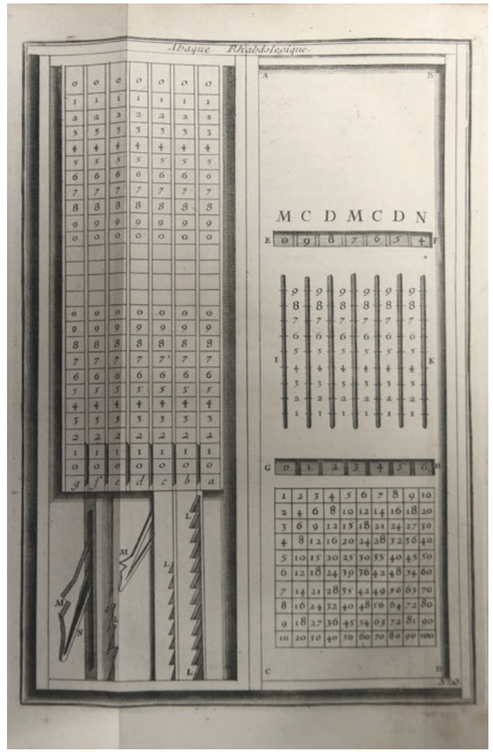
*****

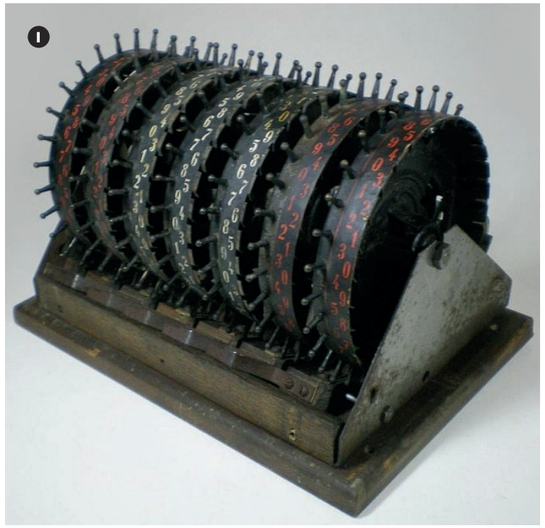
DIAKOV

Russia, 1878

Precursor of chain style adders like Gem, Webb Ribbon Adder, Dux IV etc. The device does not have an automated carry, just the carry indication. Black field indicates carry needs to be added on the next position. Diakov adder received the gold medal at the Paris World Exhibit in 1878.
Only one known (?).

WS-22



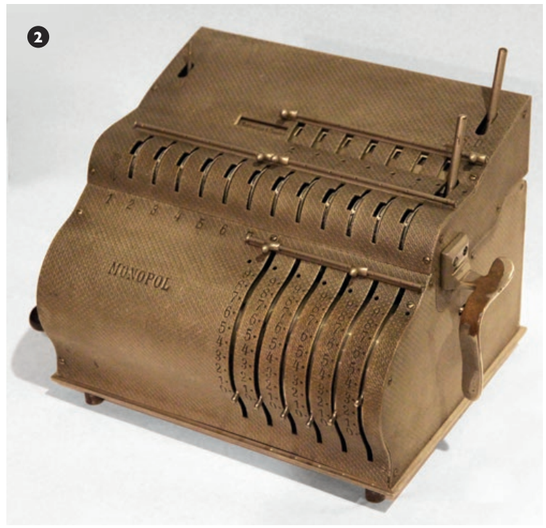


1 SIRIUS

Germany, 1912

Very rare. Few are known.

WS-202



2 MONOPOL

Germany, 1902

Very interesting, very rare, very heavy and "very" collectible Odhner type machines.

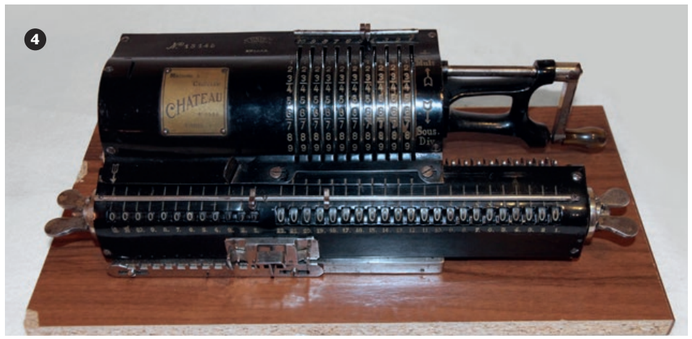
WS-678

3 L'ÉCLAIR

France, 1912

Huge, Odhner type calculating device. It is very rare, heavy, unusual, and interesting.

WS-330



****

4 22 DIGIT ODHNER

France, 1929 (?)

22-digit Odhner type calculating machine (Chateaux).
It is 2 more digits than modern 64-bit computers. The first Odhner type machine with such capacity. Only one known.

WS-327

*****

5 GRAVE ET LENOIR

France, 1850s

On the left 1st known demonstration slide rule – Gravet et Lenoir (France, 1850s). No other one known. Next a very rare first American demonstration slide rule. Keuffel & Esser 4061(?), (US, 1900).

WS-696

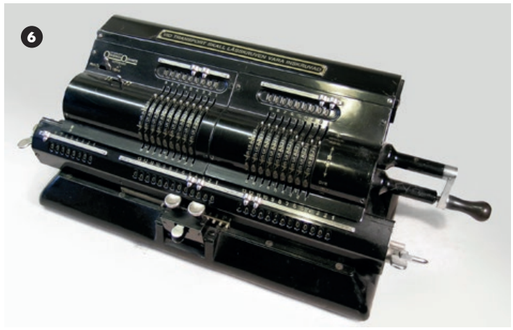
*

7 DUAL ADDER

US, end of XIX / early XX century

64 × 32 cm – big. Only one such double adder known.

WS-612



***

6 ODHNER TANDEM

Sweden, 1931

Odhner's 1st attempt to create duplex machine. These types of machines were useful for "complex" calculations such as calculation of artillery trajectories, land surveying or navigation. Only few are known to exist.
Later Odhner manufactured "double" Odhners: models 35 and 135. The first manufactured machine of model 135 is also in the collection.

WS-745

****

❶ WEBB ADDER

US, 1889

Very early Webb adder 1889 model (US). Charles Webb invented a few calculating devices, in 1868 he patented his Webb adder, later in 1889 he patented an improved version. This device is a very early 1889 model, different from later versions. Only one known.

WS-57

*

❷ BEAUCOURT

France, 1912

Beaucourt adder. Very rare column adder with an unusual rotary "telephone" dial input.

WS-50

**

❸ HOLIAC

US, 1963

Logic teaching aids to emulate computer operations. Parker W. Snapp designed these devices to teach students how the computer works. Only one known to exist.

WS-622

*****

❹ GROESBECK

US, 1870

Groesbeck adding device. It was the first device of this type manufactured in US that had some commercial success.

WS-39

❺ ARCHIMEDES

Germany, 1930

Fractions' teaching device. Each apple shows how it can be divided (fractioned) into different size pieces. E.g., one of the apples is divided in ½, ¼, and two 1/8 pieces.

WS-643

❻ FINGERS

Germany, 1921

Fingers by Lehrer Wlecke. Teaching device for basic arithmetical operations. Different from other teaching aids. Designed for teaching arithmetic to children with poor numeracy skills.

WS-171

***

EUREKA

France, 1889

For teaching multiplication table and adding. User sets one "marker" on a multiplicand and another on a multiplier. Arrow shows the result. Eureka was a precursor of several toys/educational devices. E.g., Consul the Educated Monkey (1916).

WS-159

***

LITTLE ACCOUNTANT

Germany, late 1800s

Teaching device for multiplication and adding.
Very similar to Eureka.

WS-158

****

❶ GENAILLE-LUCAS

France, 1885

Genaille-Lucas multiplication device. The first device to directly read multiplication results without mechanical carry or without mentally adding carry (Napier, Roth) or selecting a state of the next position (Slonimski, Filipowski, Joffe).

WS-178

**

❷ GENAILLE-LUCAS INTEREST CALCULATOR

France, 1885

Genaille-Lucas interest calculator,
Les Reglettes Financieres.

WS-179

**

❸ NUMEROMETER

US, 1885

Very simple adding device. When a device indicated carry user had to add one in the next decimal position. Lowest position was for adding 1/8 fractions. Only one known.

WS-608

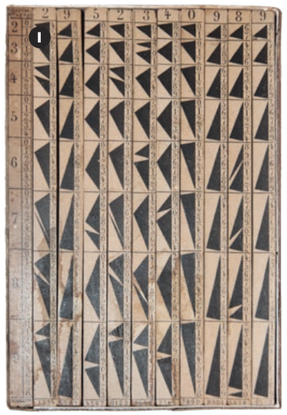
**

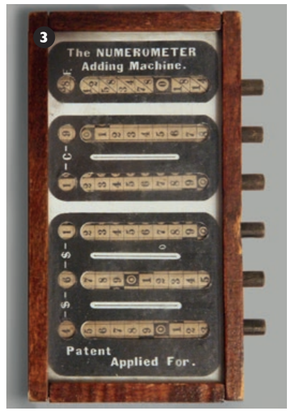
❹ TOTALISATEUR TRONCET

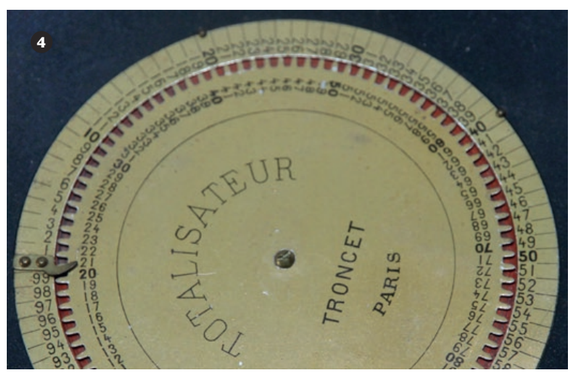
France, 1895

A simple dial adder. Unlike Arithmograph Troncet (1889) it did not support carry enforcement. Because of this, and its size, it never became popular.

WS-48







FOXY GRANDPA'S MULTIPLIER

US, 1904

Foxy Grandpa was a comic strip created by cartoonist Carl E. Schultze. This simple tin reckoner was an advertising for a shoe company.

"*The strip revolved around Foxy Grandpa, an elderly gentleman, with two mischievous grandsons (Club and Bunt) who constantly try to trick him. Foxy Grandpa, however, always managed to get the better of the two boys, combiing brains with a perverse sense of humor, while demonstrating skills at acrobatics, illustration and construction of various small devices.*" (Wikipedia)

WS-186

HIGHLIGHTS

****

1 ARITHMOGRAPHE TRONCET with integrated with a Genaille

France, 1907

Arithmographe Troncet (addiator) integrated with a Genaille multiplying device. It is an unusual variety of Genaille multiplication device (189?). Only one known.

WS-150

*****

2 ARITHMOGRAPHE TRONCET pour les quatre operations; Le Calcul Instantane

France, 1889

Arithmographe Troncet (addiator). Troncet popularized addiators invented 40 years earlier by Kummer. Addiators were cheap, easily portable and allowed to add and subtract. Several different companies manufactured them. Addiators became the most popular "personal" adding devices. They were manufactured till 1970's. At the end of their lifetime hexadecimal and octal versions were used to debug computers..

WS-149

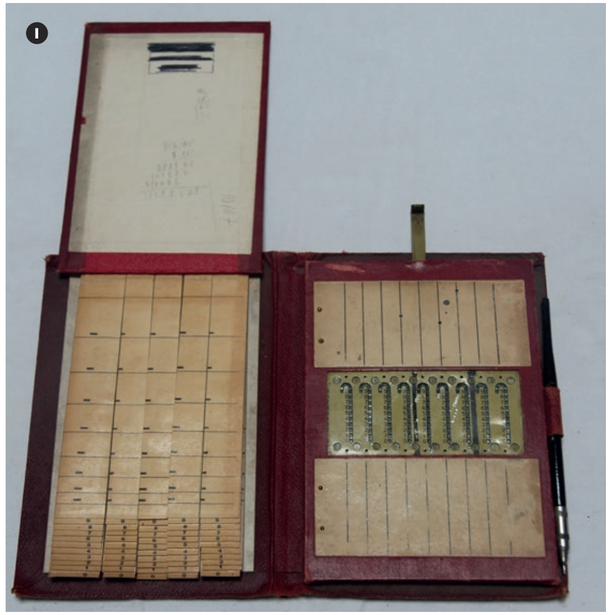
****

3 ARITHMOGRAPHE TRONCET with Napier

France, 1907

Arithmographe Troncet an integrated with Napier multiplication device.

WS-151



**

4 DILWORTH

US, 1906

Dilworth adder, the first US addiator. Dilworth adder did not support Kummer/Troncet carry enforcement. Device indicated that carry needs to be added and user needed to add 1 on the next decimal position manually.
Only one is known.

WS-758

**

5 HEXADAT AND OCTADAT

Germany, 1967 and 1968

Devices for debugging computer programs – for calculations in hexadecimal (Hexadat, 1967) and octal (Octadat, 1968) arithmetic. They were both made by Addiator in Germany. Earliest device was a rotary IBM Hexadecimal Adder (US, 1962). Hex Adder was introduced by Hexco Inc in US in 1968.

WS-153

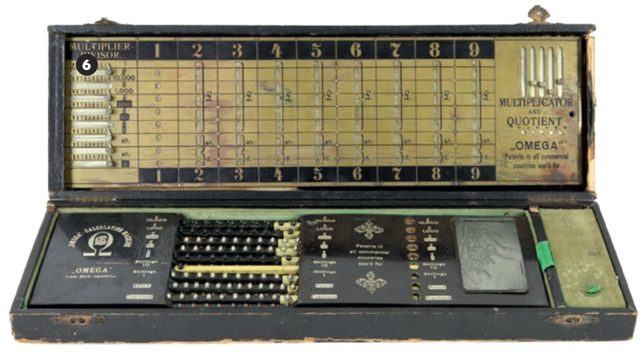
****

6 OMEGA BAMBERGER

Germany, 1905

Combined adder with Napier multiplying device. This device supports "Napier" multiplication for British currency. The only known Napier device to support British currency. The only one known to exist.

WS-749



**

1 DUX IV

Denmark, 1910

Band adder with totalizator. Very rare. Based on the same calculating principle as Gem adders (US, 1904).

WS-20

2 PITAGORA-900

Italy, 1920s

Multiplication device for single digits. Just a beautiful, simple design.

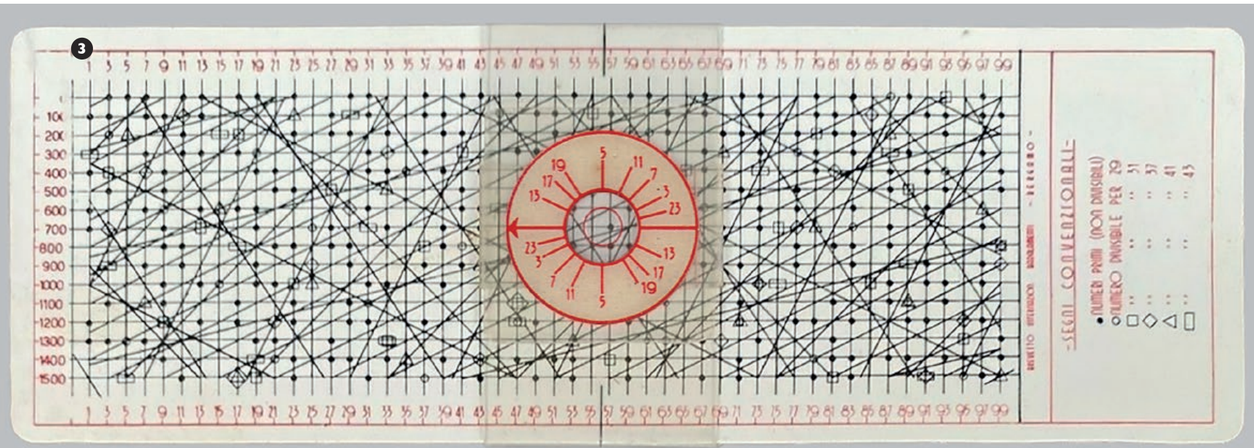
WS-200

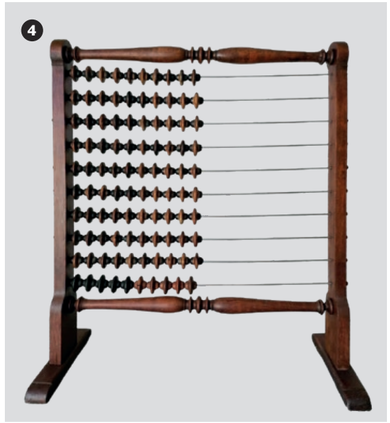
3 BADALAMENTI

Italy, 1958

Badalamenti Factorization Rule. Allows to find prime factors of numbers. Badalamenti won gold medal at the XI international salon of inventions at Brussels in 1962. Very rare and unique type of device.

WS-747





4 DEMONSTRATION SCHOOL ABACUS

Germany, XIX century

Demonstration school abacus.

WS-746

5 COMMONWEALTH ADDING MACHINE

US, 1915

Commonwealth Adding Machine. Very rare, manufactured only for a very short time.

WS-658

6 MUTLIREX-MULTOR

Austria, beginning of XX century

Multirex-Multor multi-digit multiplying device. "This little magic device shouldn't be missing from any pocket or intellectual's desk. "Multirex" protects the nerves, saves 50% time and allows to eliminate any human brain error, especially in mental arithmetic". Very rare, unusual, and very complex to use :).

WS-770

*

7 QUIXSUM

Providence, RI, USA, 1924

Very rare fractions' adder for feet, inches and fractions of the inches. Made in Providence RI, where we used to live.

WS-105

HIGHLIGHTS

*

1 VON-FUNKE

Germany, 1945+

Von Funke adding device. Very interesting and different method of calculation. Josef von Funke, in 1925, designed a device that was enforcing carry based on the geometrical principle. For each number added, a corresponding proportional "part" of a carry is "added".

WS-752

2 MECHANICAL ACCOUNT

Providence, RI, USA, 1900

The devices made in Providence were Mechanical Account (1900) Created by Joseph Turck and a little shopping device. In 1911 Turck joined Felt&Tarrant (Comptometer) where he became a chief designer. Turck also published "Origin of Modern Calculating Machines" (1921).

WS-264

3 UNITAS

Germany, 1907

This arithmometer is equipped with a totalizator, a register to keep results of several calculations. Devices with totalizator were rarer as they added complexity and increased the price. Other machines with totalizators in the collection are: Millionaire (Switzerland, 1918), Todd Visible Adding Machine (US, 1926), Brunsviga Trinks MG prototype (German, 1926), Comptometer ST (Super Totalizator) (US, 1928), DUX.IV (Denmark, 1910). Unitas was manufactured by Ludwig Spitz, same company that made Multirex in Austria.

WS-228

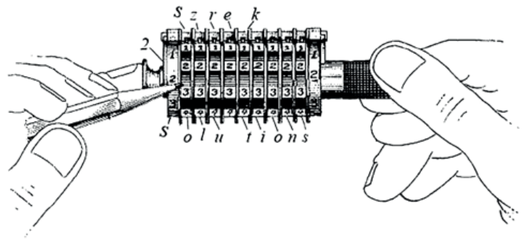
*

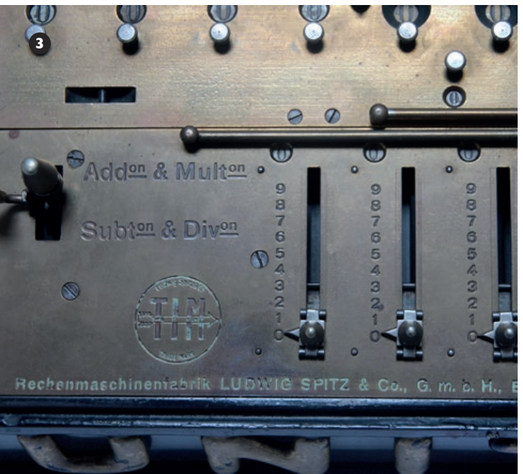
4 MIDGET

US, 1910

Midget Adding Machine. Small US device for adding only. Few machines were manufactured.
Drawing by Piotr Kaczmarek, was used on the company business card of Szrek2Solutions LLC.

WS-49





HIGHLIGHTS

1 SPECIAL PURPOSE FACTORIZATION DEVICE

US, 1836

Special purpose factorization device (1836) The device shows factors of the numbers. It is not clear the device's use, as not all numbers' factors are present. Only one known.

WS-718

*****

2 PROTOTYPE FRACTION ADDER

US, XIX century

Protoype fraction adder. The actual adder was never manufactured.

WS-620

*****

3 FOSSA MANCINI

Italy, 1896

Fossa-Mancini Somatrice Automatica. The first Italian adding machine manufactured in a small quantity. Precursor of many machines of the same type.

WS-203

****

4 YOUNG

US, 1851

Interest calculating device. Samuel Young patented three simple and similar calculating devices (1849, 1851 and 1858). Smithsonian Institution owns patent models for 1849 and 1851 devices. Except patent models owned by Smithsonian Institution, this is the only known example of Young's calculating devices.

WS-144

*****

5 HATFIELD

US, 1854

Hatfield adder. Aaron Hatfield invented the first (US) rotary adder commercially sold. Only a small number of these devices survived.

WS-43

*

7 CYCLONE

US, 1897

Cyclone Adding Machine. A unique adding machine. Only one known to exist. It is very nice, big, heavy and a bit cumbersome to use.

WS-44

****

6 HART

US, 1878

Hart's Mercantile Computing Machine adder.

WS-45

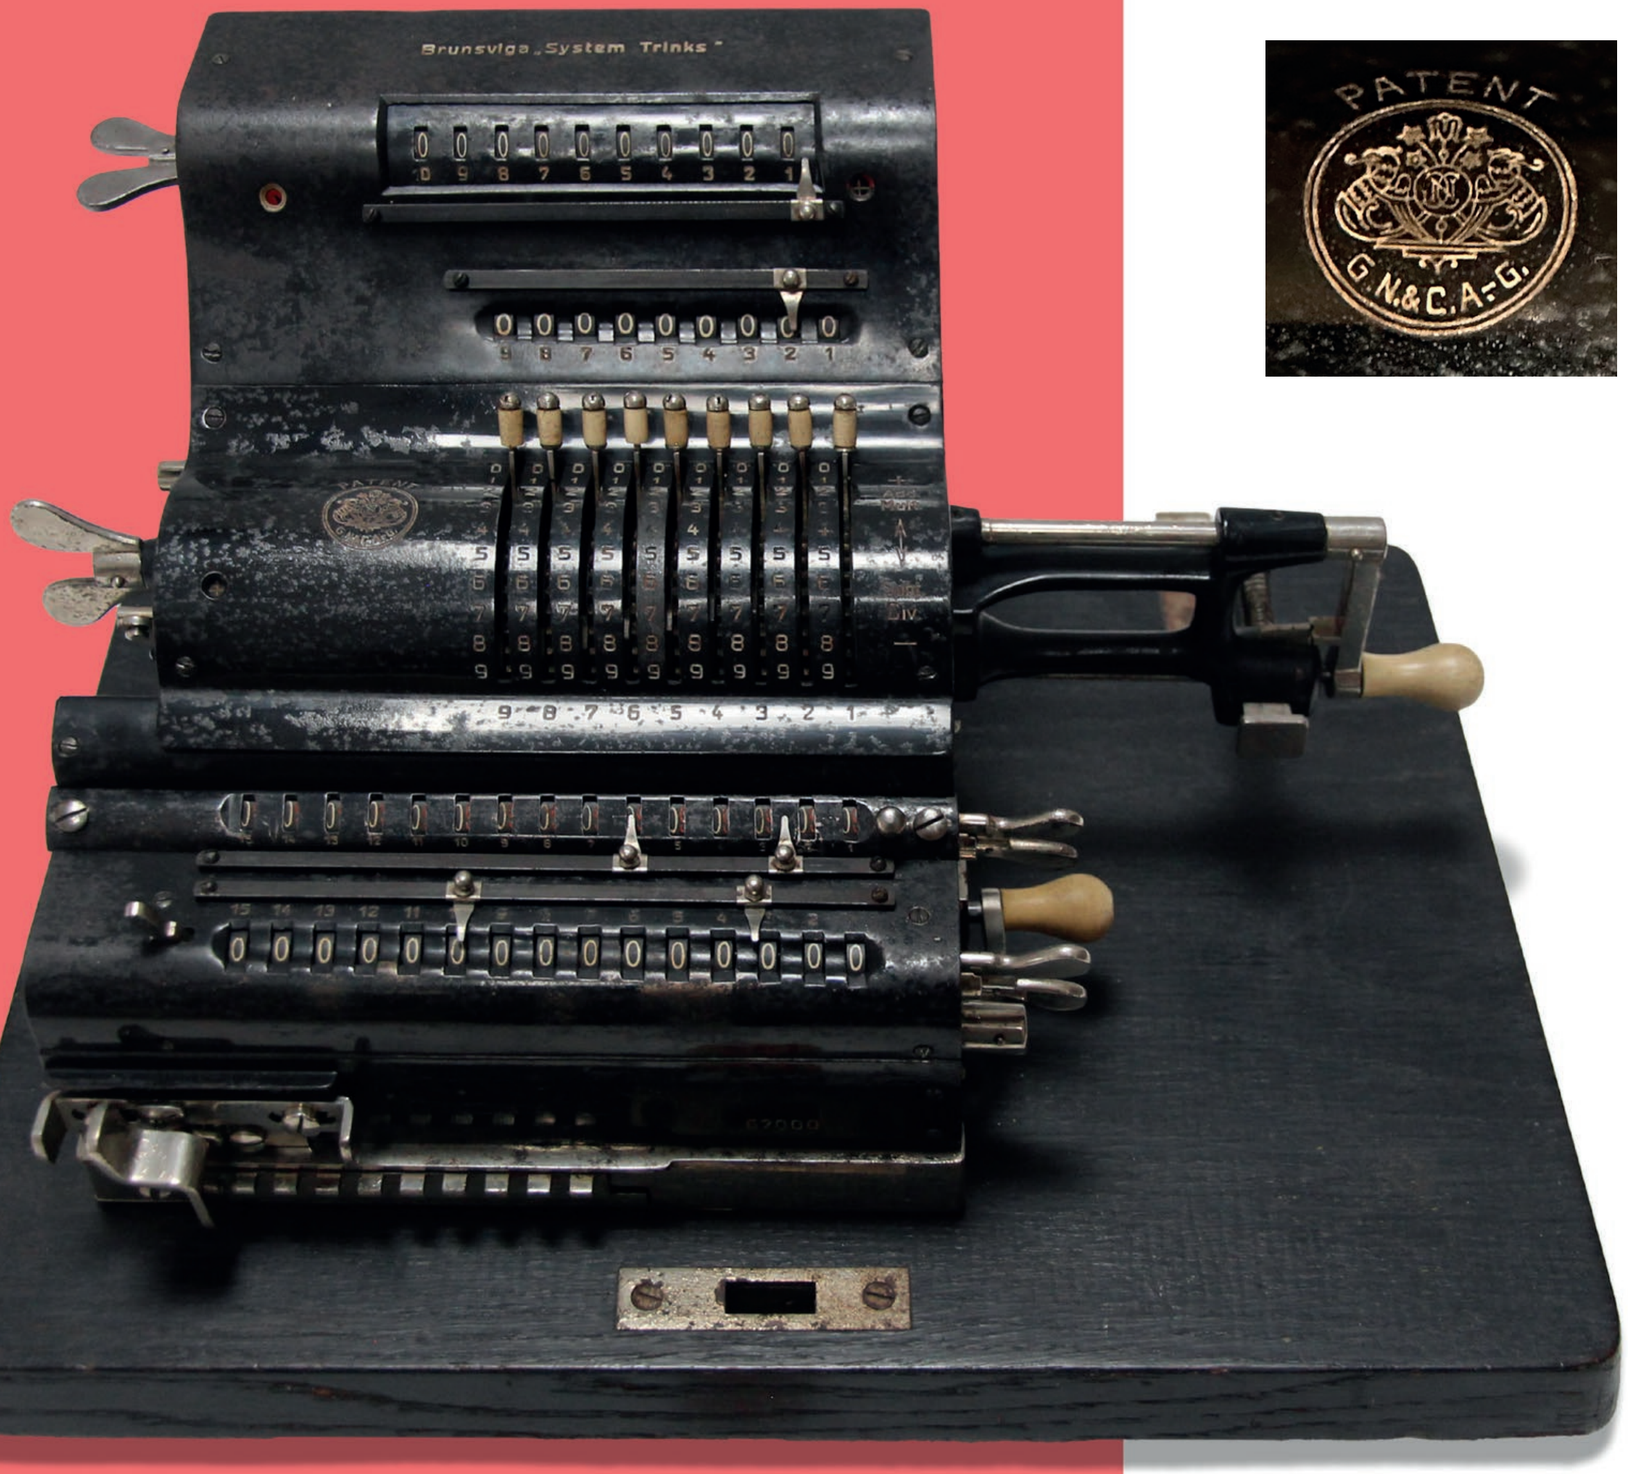
**

8 SIBLEY

US, 1930

Sibley's set of "attached together" slide rules to create a graph of results of multiple operations. (~1930). Elbridge Sibley was a statistician. He designed this slide rule for his own needs, to be able to estimate calculations' results. User makes all the desired operations on slide rules, then covers the device with a transparent graph paper and "draws" a graph of results. Device was owned previously by Elbridge Sibley. Only one known.

WS-698



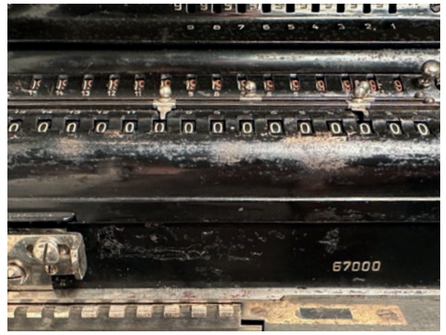
***

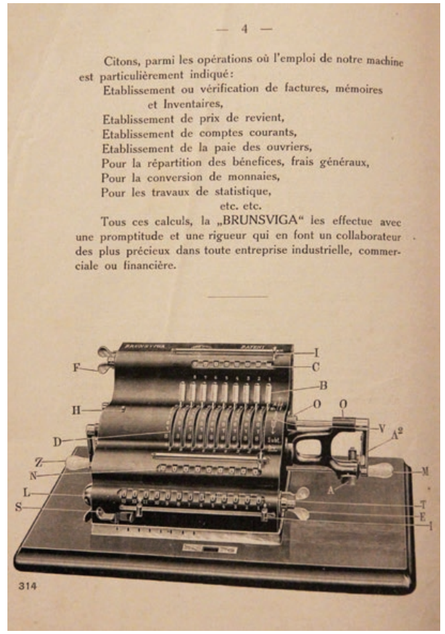
BRUNSVIGA TRINKS

Germany, 1924

Brunsviga Trinks MG prototype with totalizator (1924). Brunsviga made 6 different prototypes of model MG. None went into production. Only two (different) prototypes survived. This machine is listed in Brunsviga collection catalogue.

WS-363





— 4 —

Citons, parmi les opérations où l'emploi de notre machine est particulièrement indiqué:

Etablissement ou vérification de factures, mémoires et Inventaires,
Etablissement de prix de revient,
Etablissement de comptes courants,
Etablissement de la paie des ouvriers,
Pour la répartition des bénefices, frais généraux,
Pour la conversion de monnaies,
Pour les travaux de statistique,
etc. etc.

Tous ces calculs, la „BRUNSVIGA" les effectue avec une promptitude et une rigueur qui en font un collaborateur des plus précieux dans toute entreprise industrielle, commerciale ou financière.

1 FRENCH ADDING MACHINE PROTOTYPE

France, mid XIX century

French adding machine prototype mid XIX C. This device was in Malassis collection. This device is attributed to Roth.

WS-42

*****

2 BALDWIN

US, 1873

Baldwin's patent model for Lumber measurer (1873).
Up to 1880 Patent Office required that with every patent submission a patent model must be provided. This patent model is for Baldwin's lumber measurer, *"a machine which automatically measured and recorded four different kinds of lumber at the same time. This device set me thinking about computing machines…"* (Baldwin Interview 1919).
Frank Baldwin was one of the creators of US calculating industry. See Baldwin Arithmometer.

WS-713

***

3 GORDON

US, 1878

Gordon's Adding Machine. Very rare adder.
A few are known to exist.

WS-85

**

4 BILL

US, 1878

Bill's Patent model for Adding Machine.

WS-714

5 UNKNOWN

US, 1850s

Unknown device (adder). This is, I think, a patent model.

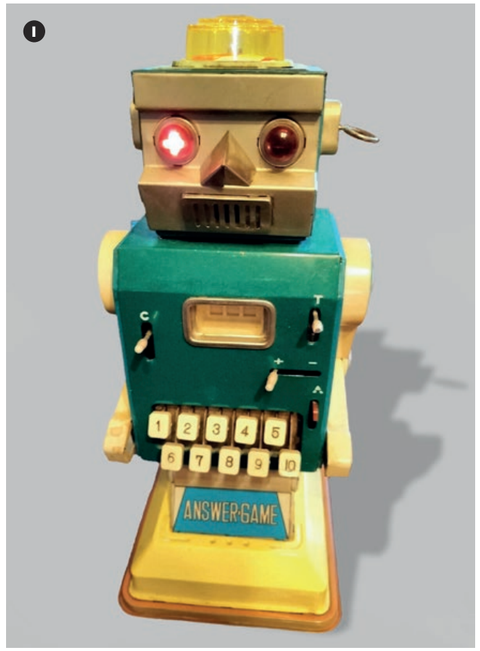
WS-184

1 ANSWER GAME MACHINE

Japan, 1962

The Answer Game Machine. The battery-operated robot was made by Ichida, a Japanese toy robots' manufacturer in 1962. Very rare.

WS-778



**

2 GALTON BOARD

Germany, „before 1932"

Very rare Galton Board. Galton Boards (also called QUINCUNX) are not used for adding or any other calculations. They demonstrate distribution of independent random events. Galton Boards are manufactured since the end of the XIX C or beginning of XX C.
This device is from "before 1932", the repair date on the back. Galton boards in Wikipedia: The Galton board consists of a vertical board with interleaved rows of pegs. Beads are dropped from the top and, when the device is level, bounce either left or right as they hit the pegs. Eventually they are collected into bins at the bottom, where the height of bead columns accumulated in the bins approximate a bell curve.

WS-779

***

3 MATHEMATISCHE BREFTASCHE

Germany, 1860

Matematicsche Brieftasche
mit Ingenieur-Messknecht. A book with an interesting device for land surveying.

WS-719

France, 1930

French cryptographic device. An improved mechanical version of the "transpositeur" by Paul Godillon.

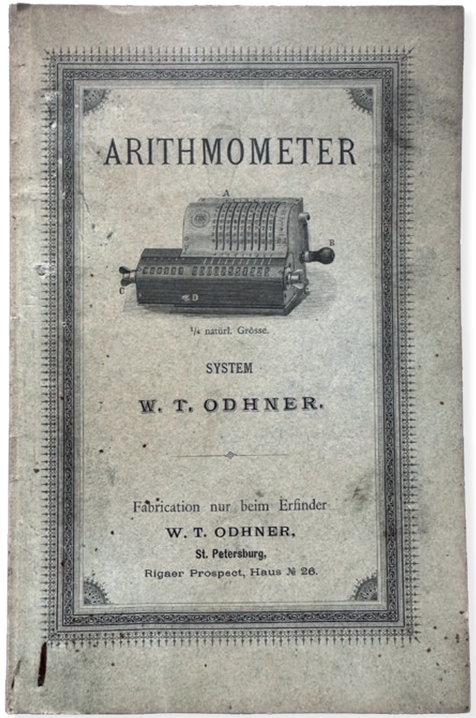
WS-196

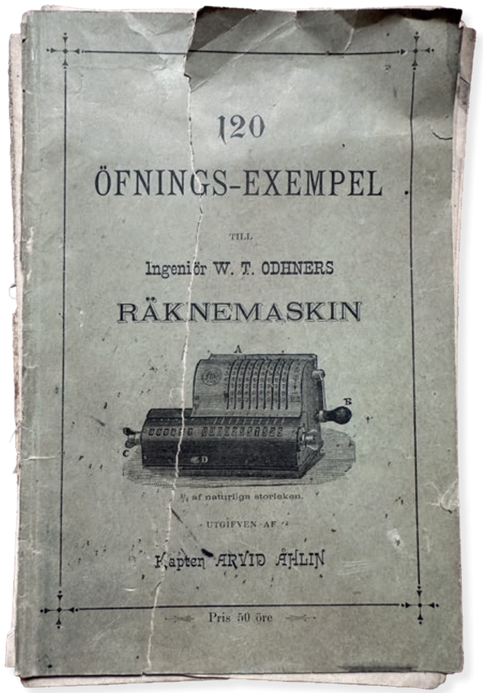
7 MAUREL ALARM CLOCK

France, 1850s

Timoleon Maurel was a French clockmaker who designed Arithmaurel calculating machine. His machine won a gold medal in 1849 French Exhibition.

WS-737



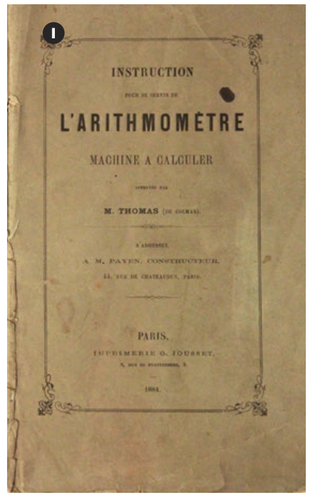


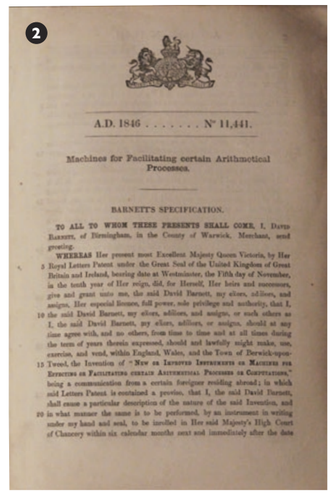
*****

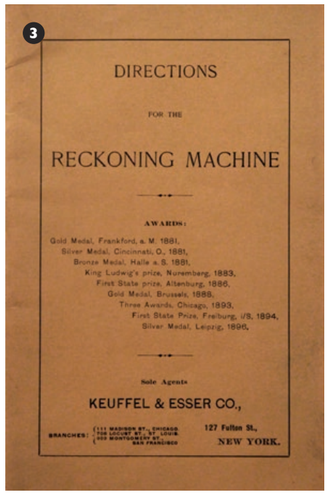
ODHNERS ARITHMOMETER INSTRUCTIONS

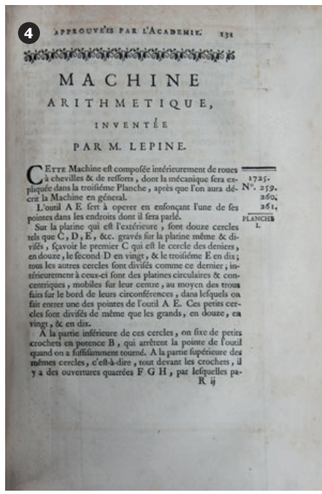
Germany, Russia, 1891

First Odhner Arithmometer's instructions in German and Russian (1890) and a Swedish booklet (1891) with sample usage for Odhner Arithmometer. These operating instructions are very rare. Use examples are extremely rare.









*****

1 1854 INSTRUCTIONS

France, 1854

1854 instructions for operating Thomas Arithmometer

*****

2 SLONIMSKI PATENT

UK, 1846

Slonimski's UK patent for his adding and multiplying devices (1846). Slonimski sold UK and US patent rights for his devices to David Barnett and Samuel J. Neustadt from Birmingham, GB. They patented his adder and multiplying device to get exclusive rights to make them. They never manufactured them.

*****

3 K&E 1896 INSTRUCTIONS

US, 1896

K&E instructions for operating Burkhardt Arithmometer

*****

4 GALLON'S MACHINES

France, 1735

Lepine's invention from Gallon's "Machines et Inventions Approuvee…", complete 6+1 volumes (1735). The books are a compilation of French inventions from 1650 till 1768. With each invention description there are also beautiful engravings illustrating these inventions.

*****

1 THOMAS DE COLMAR PATENT

France, 1820

Thomas de Colmar original 1820 patent for his arithmometer in "Description des Machines et Procedes…" (1828). These are patent specifications for Thomas de Colmar's first patent.

*****

2 LEUPOLD'S "THEATRUM ARITHMETICO GEOMETRICUM"

Germany, 1762

Leupold's "Theatrum Arithmetico Geometricum" (printed in 1762). The best book on calculation published in XVIII C. Between 1724 and 1739 Jacob Leupold published "Theatrum Machinarium" – an encyclopedia of technology in ten volumes. This is the eighth volume. Engravings of calculating instruments, machines and surveying devices, including those of Schott, Grillet, Leibniz, Poleni, and Leupold himself.

*****

3 RADDOLOGIA

Italy, 1623

"Raddologia" by Napier. Book introduces Napier's bones and it includes Arimmetica Locale, treatise on Binary arithmetic. First Italian edition (1623).

*****

4 SCHREIBMASCHINE AND RECHENMASCHINEN

Germany, 1925

Ernst Martin's "Schreibmaschine" (1920) and "Rechenmaschinen" (1925).
Rechenmaschinen is regarded "The Bible" for calculating devices collectors. To illustrate and add value to this book Hebert Schneemann and myself created a website www.rechenmaschinen-illustrated.com.

****

5 THE BUSINESS MACHINES AND EQUIPMENT DIGEST

US, 1927

1927 edition of "The Business Machines and Equipment Digest" by Equipment Research Corporation. Very rich and interesting compendium of different office machines and devices.

EXHIBITION ROOMS

CHAIN ADDERS

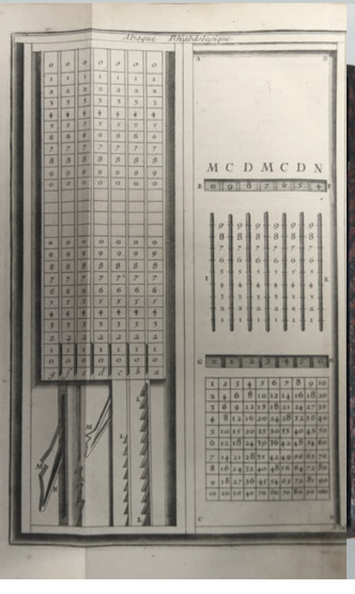
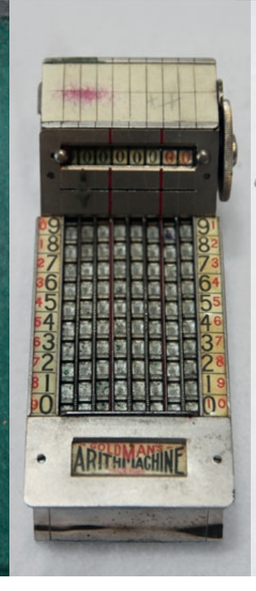
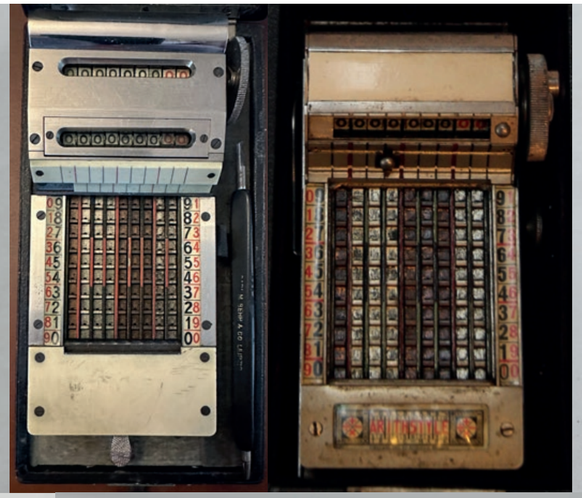
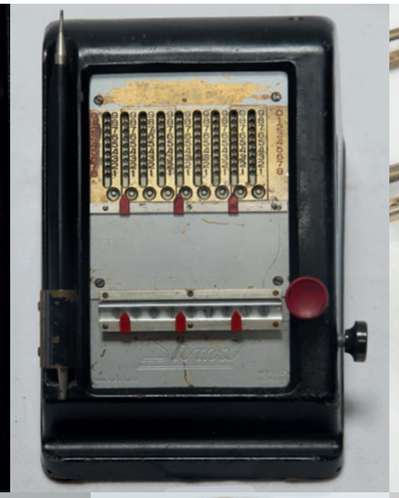
These devices use a band/chain (like Diakov, Triumph, Gems), spiral (like Cheape), or a set of slide bars that could be moved vertically to indicate numbers added (Landing, Arithmachine, Rapid Computer, …). These devices usually support addition and subtraction. For subtraction a complement's method is used. Diakov, a big square device below, was the first device of this type. It won a Gold Medal in Paris World Exhibition in 1878. Landin (1891) was the first slide bar machine; Arithmachine (1899). They inspired several manufacturers to provide machines working on the same principle. Historical devices: Diakov (one known, 1878), Landin (one known, 1891), Arithmachine (few known, 1899). Very rare: Contostyle (first manufactured, 1906), Argos (1913), Behr/Greif (1908), Cheape (1917), Surot (1920), Addo (1919), Triumph (1910), some Gem adders (1904), Dux (1910), Bassett (1910). Engraving of Perrault's adder is from Gallon's "Machines et Inventions Approuvee" (1735).

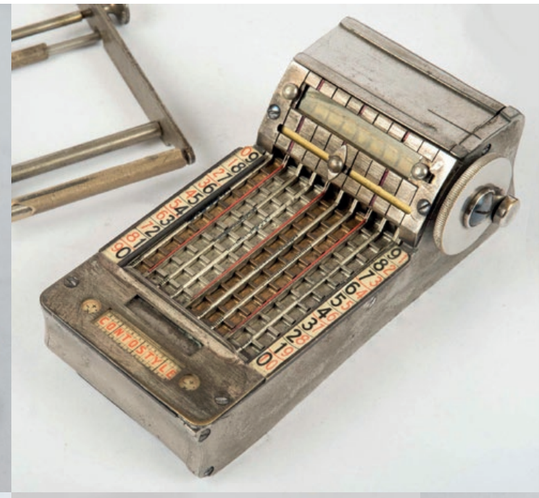


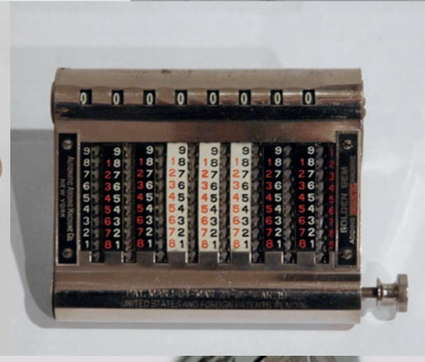


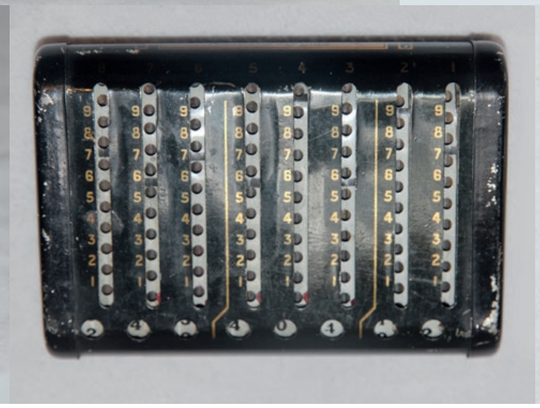
EXHIBITION ROOMS

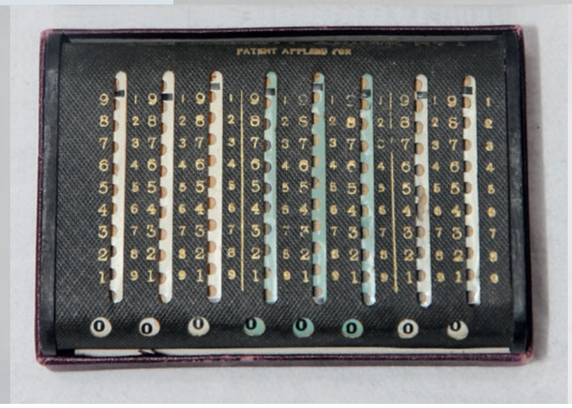








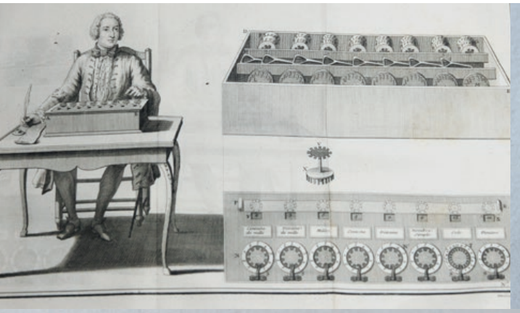


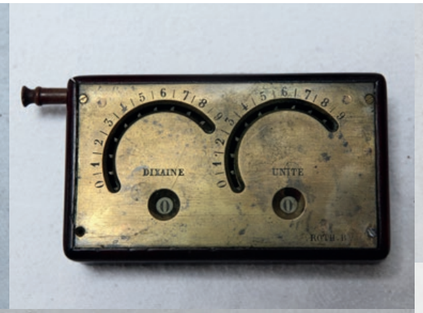


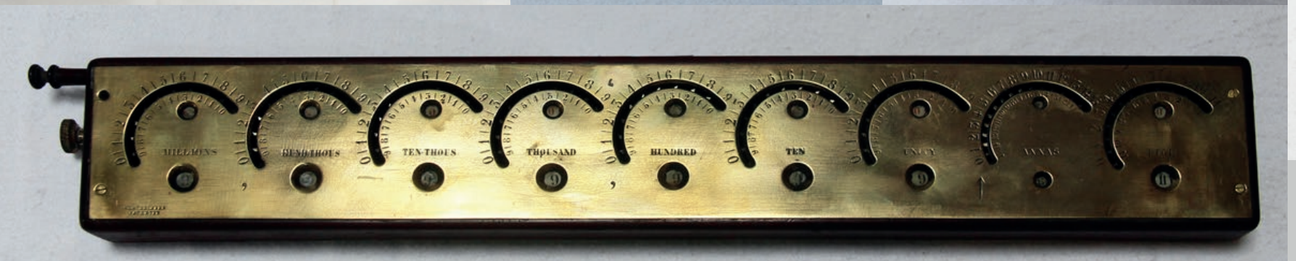
EXHIBITION ROOMS

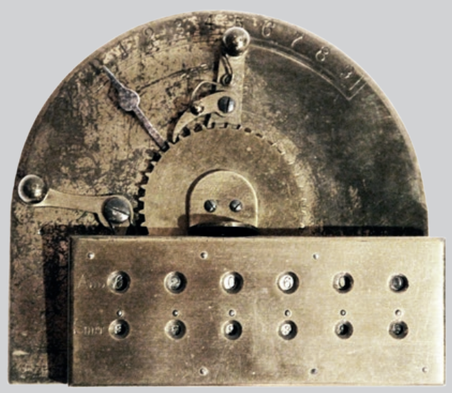
ROTARY ADDING MACHINES

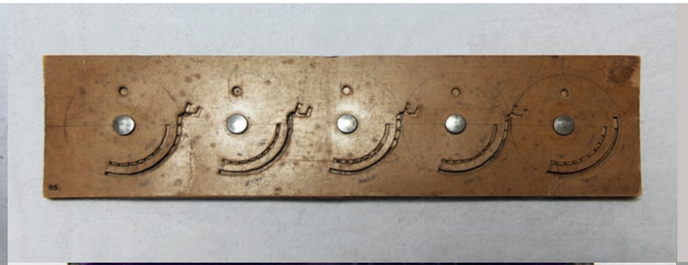
First adding machines were invented by Schickard (1623) and Pascal (1642). The main ingeniousness of their invention was how to input the numbers (for addition). These devices usually support addition and subtraction. Subtraction is either by a complement's method or, on several machines, by moving wheels in a reverse direction. Roth invented a few different calculating devices (in this collection: 3 machines below (1842) and a reproduction of multiplication device). Roth introduced the first relatively cheap and successful rotary adding machine. Baldwin Arithmometer (1874) is the first calculating machine introduced by one of the fathers of calculating machines industry in US. The Bonham & Schram adder design was repeated by several successful manufacturers. Historical and very rare: Roth (three adders, 1842), Baldwin Arithmometer (1874), Bonham & Schram (1905). Very rare: mid XIX C Roth adding machine prototype (attributed to Roth), Groesbeck (1870), Cordingley's Comptometer (1890), Compteur Lafond (1899), Universal Recorders (cash register or rather a huge adder (1932)), Midget Adding Machine (1910), Conto A (1912), B and C, Bonham & Schram (1905) – very rare predecessor of many successful rotary adding devices, Tellad (1958) shopping cart adder (unique) with original grocery advertisements, Gypsy Hosiery Adding Machine (advertising hosiery early XX C), O.J. Adder (1950) – very interesting British Money adder, Baum (1913), 5 digit Calcumeter (1901). Stephenson (1873) type adders are rare except of original model, Yale and Mindling which are very rare. Similar Belator, Mon Ami and Mein Freund are also very rare. Pascal's engraving is from Gallon's "Machines et Inventions Approuvee" (1735).

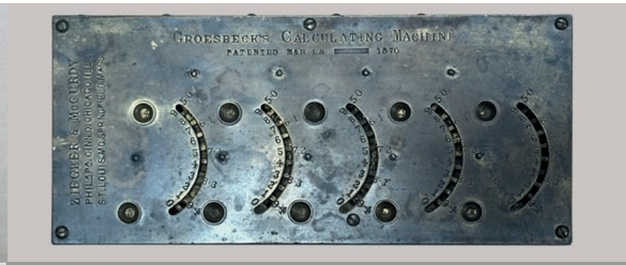




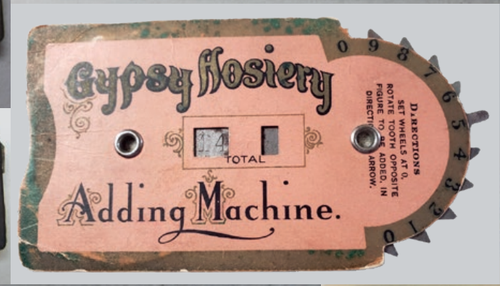


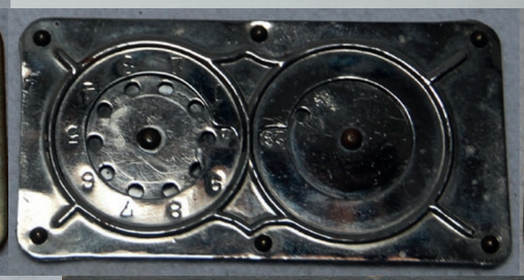


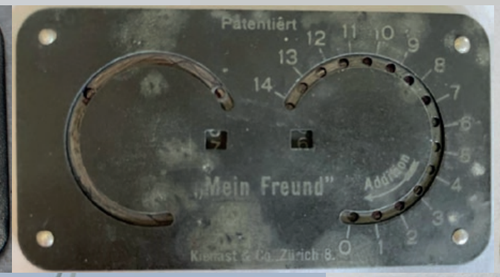


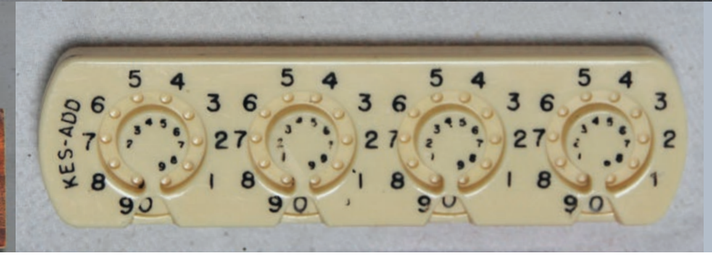


EXHIBITION ROOMS





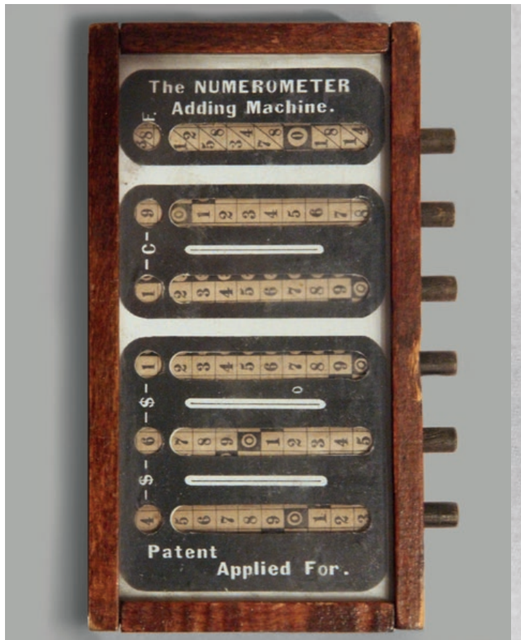


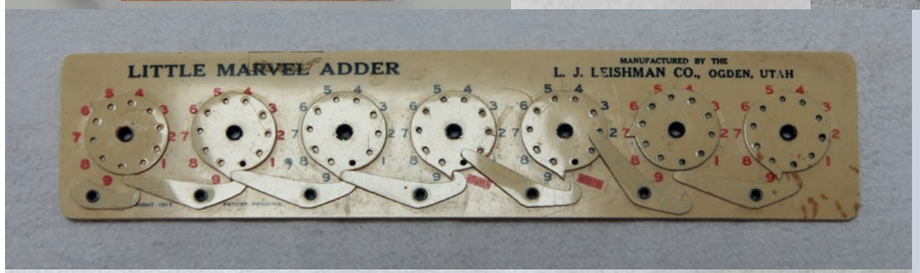


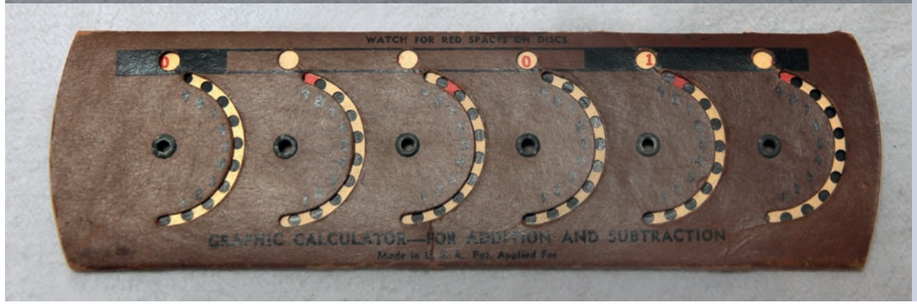
EXHIBITION ROOMS

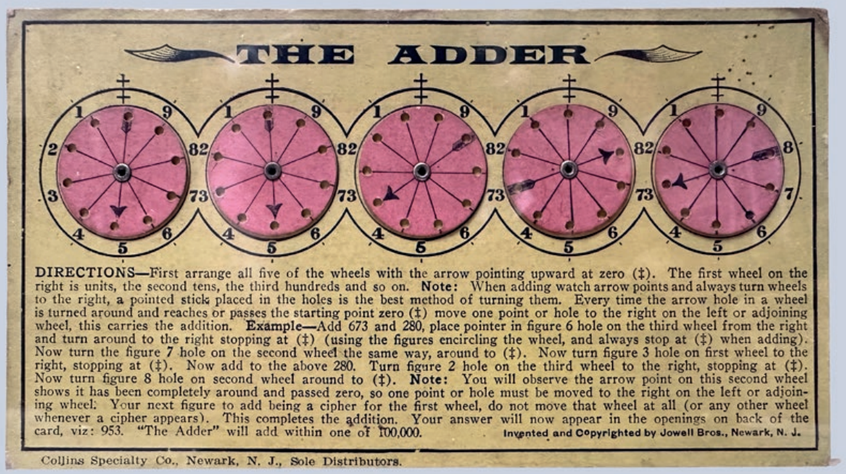
ROTARY MANUAL CARRY

These devices were used for addition and subtraction. They did not enforce carry mechanically but indicated carry should be added manually on the next decimal position. They were impractical. Numerometer (1885) is most likely unique. Other devices are rare or very rare: Totalisateur Troncet (1895), Sebastian (1898 and 1904), British Money Adder (1890?), Little Marvel Adder (1917), Matson (1949) – a very rare device with a unique way of enforcing the carry. These devices always support addition and quite often subtraction. Subtraction is either by a complement's method or, on some devices, by turning in a reverse direction.





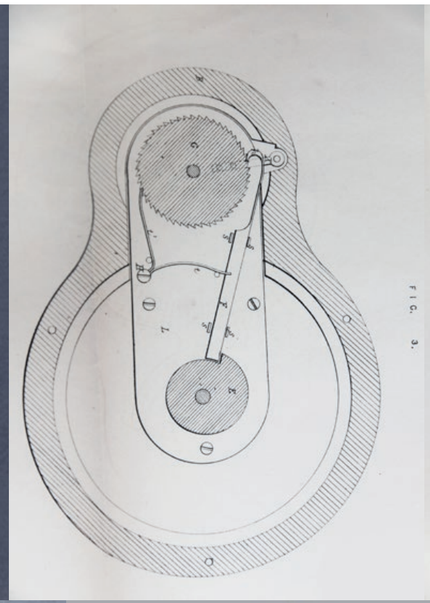


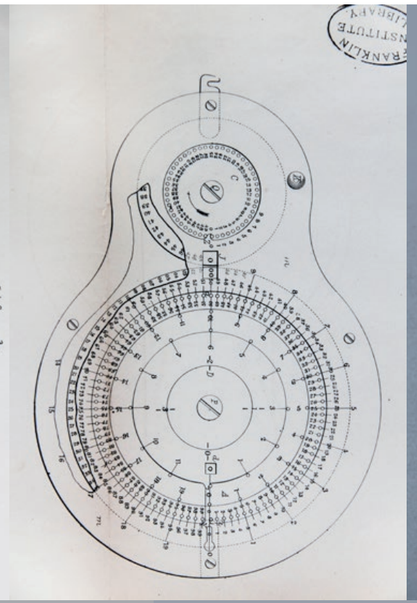


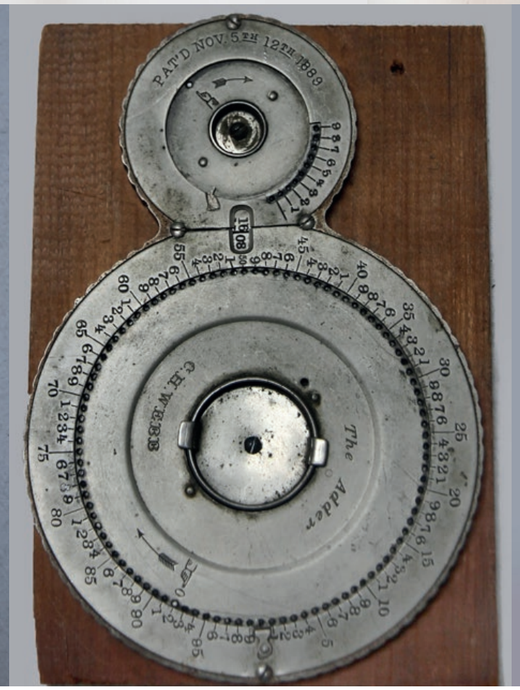
EXHIBITION ROOMS

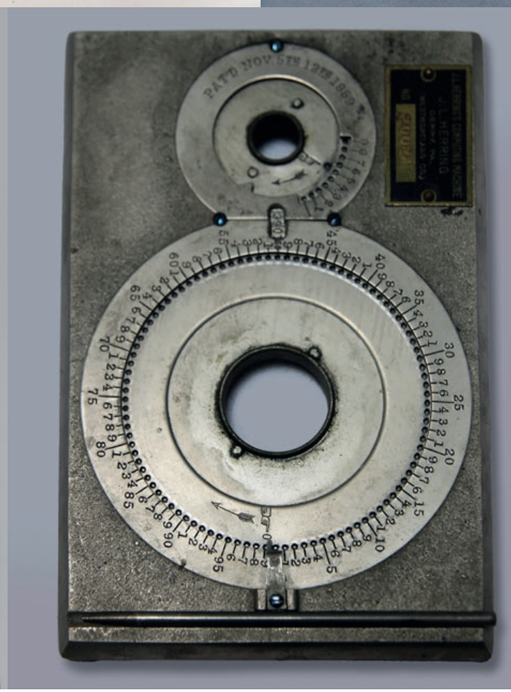
WEBB ADDERS

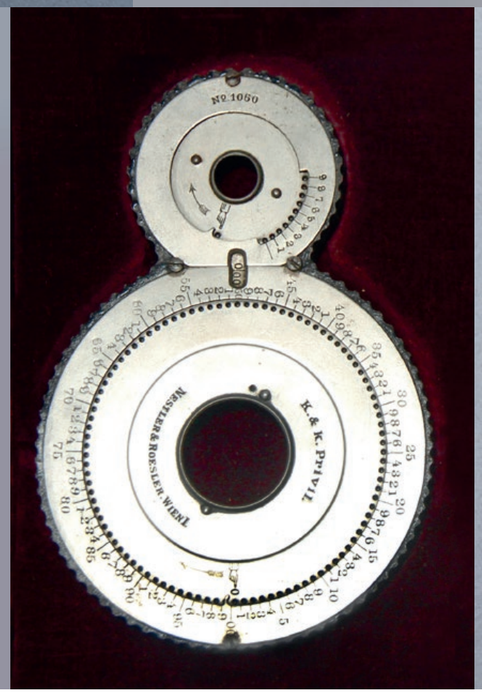
Very interesting adders invented by Charles Webb (1868). Very rare or unique adders: very early 1889 Webb Adder without middle hole (unique), Nestler & Roestler, Herring adders, 1868 patent Webb Adders. Other adders are rare. Engraving is from Webb's 1868 British patent.

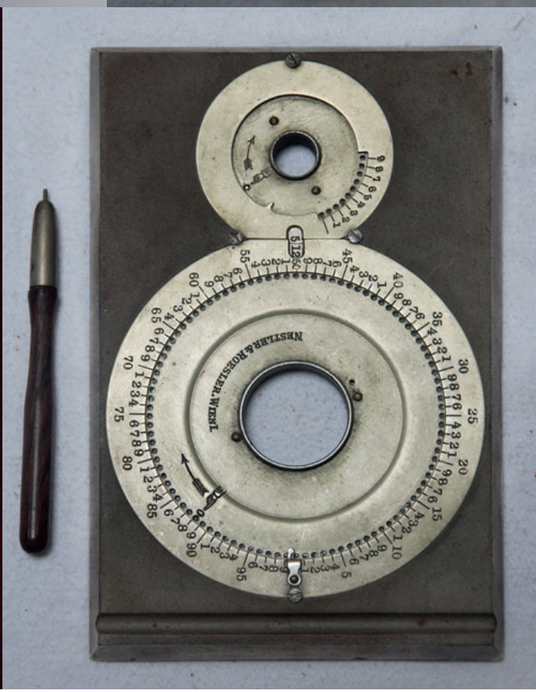








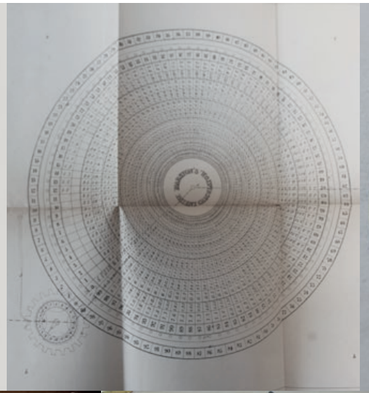


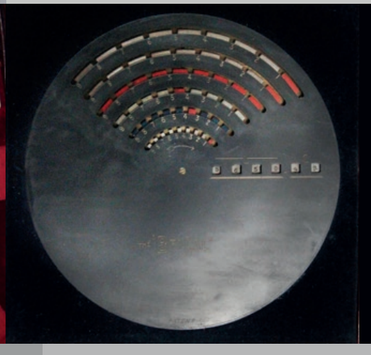


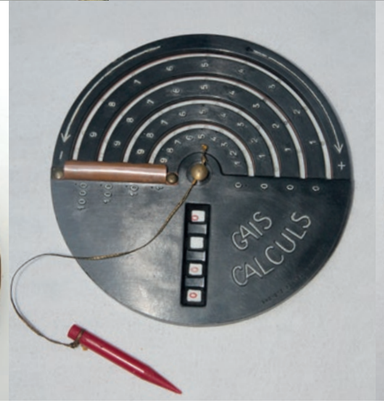
EXHIBITION ROOMS

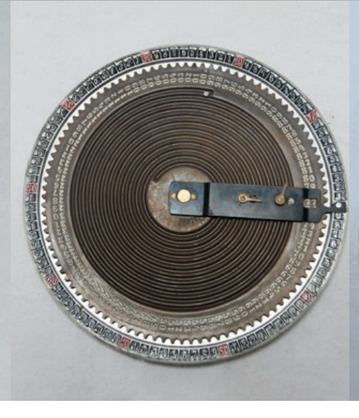
CONCENTRIC ADDERS

These devices usually do not require adding manually carry. To show correct results of addition they either mechanically enforce carry or, like von Funke and IFAC, "generate" carry using geometric principia. Hatfield (1854) is a historical device. It is the first American adder sold commercially. Unique or very rare adders: Hatfield (1854), Hart Mercantile Computing Machine (1878), Gordon (1878), Cyclone Adding Machine (1897), Beacourt (column adder), big duplex adder (unique), Von Funke, IFACH, Brical "C" (it is not a concentric adder, included here because of other Bricals), (big) Brical decimal adder, Brical, supporting operations up to £22,000, Gais Calculs, advertising Ezy-Tab. Rare Adders: Adal, Optima, BriCal for compound addition. Engraving is from 1842 Marston's British patent.









VERIFICATION

These devices were used for verification of numbers or calculation results. Unique or very rare: verifier of divisibility by 11 (Kontroler Delitelnosti 11, identity cards number's verification in Czechoslovakia), Prewett Addograph was used for verification of addition. Early model of Prewett Addorgraf is most likely unique.

PENCILS AND PENS

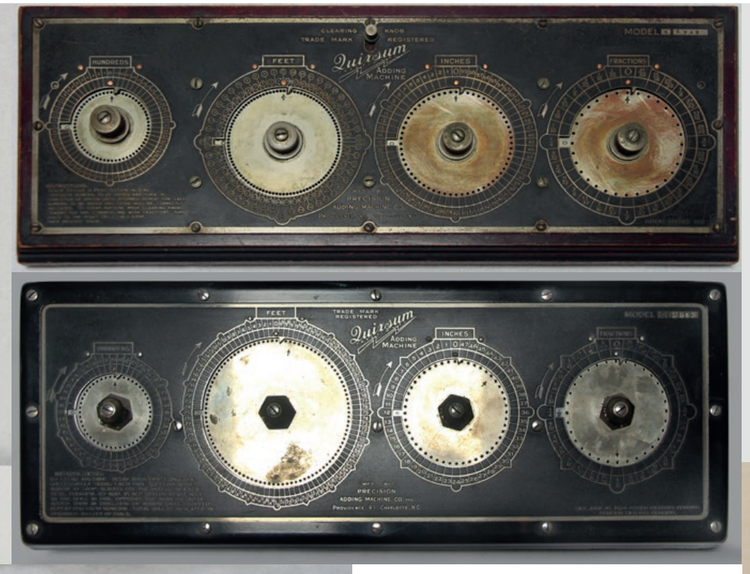
Pens and pencils were often used as multi-use devices. For calculation they can be combined with adding device, multiplication table, slide rule or electronic calculator. Chicago recording scale is a multiplication device/reckoner that could be mounted on any pencil. Very rare: Houk and Adding Pencil Company (1925-1929), Chicago recording scale (1905). Rare: Calcupen. Makeba Kombinator, and Ruxton Multi-Vider rare (?).

DRUM PENCIL BOXES

Some pencil boxes had built-in multiplication table. Very rare: Cemadeni Russian pencil box (1890?). Space ship (1960?) is rare / very rare.

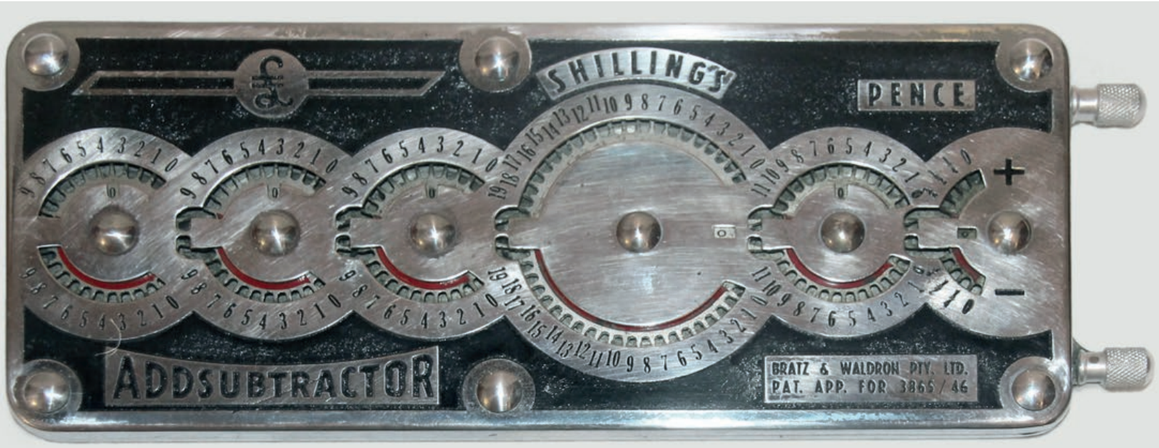
FRACTION ADDERS

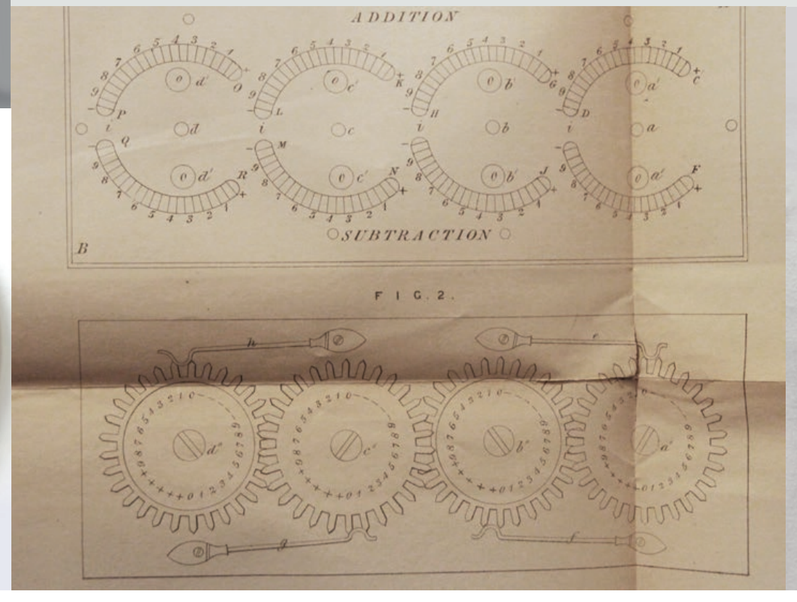
Fraction adders were used for calculations of fractions that were not in decimal systems (base 10). E.g. yards, feet, inches and fraction of the inches. Unique: XIX C fraction adder (patent model?). Very rare: Quixsum model B and Elemato Dimension Adder. Some fraction adders, e.g., non-decimal currency calculators, can be found in other rooms.



SLONIMSKI ADDERS

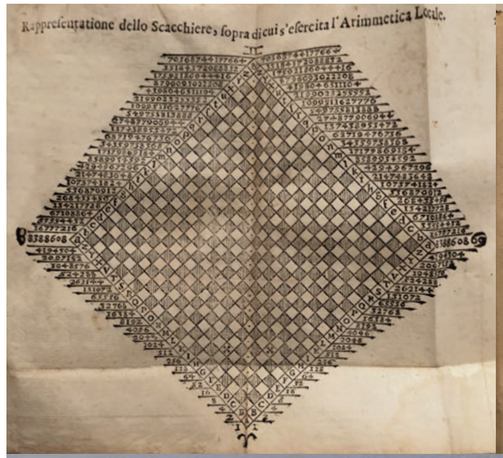
Slonimski invented a rotary adding device indicating carry and allowing to enforce carry on the next position. Support for both adding and subtraction. Based on his idea for adding device with circular wheels, Kummer (Heinrich Kummer – Computer Timeline (computer-timeline.com)) invented much simpler and practical Addiator by replacing wheels with a sliding bar and a "hook" to enforce carry. Troncet commercialized Kummer's idea. There are only a few devices based on the original Slonimski's idea. Addsubtractor (1946) and Bair-Fulton (1928) are very rare. Engraving is from Slonimski's adding device's British patent (Barnett (1847)).

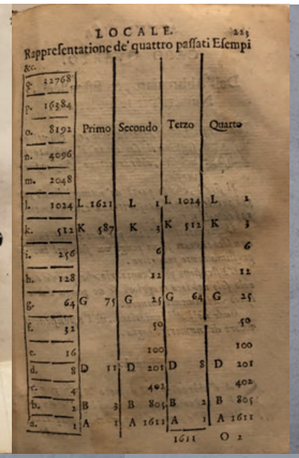


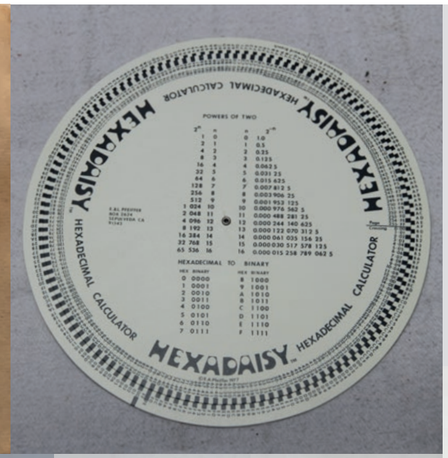


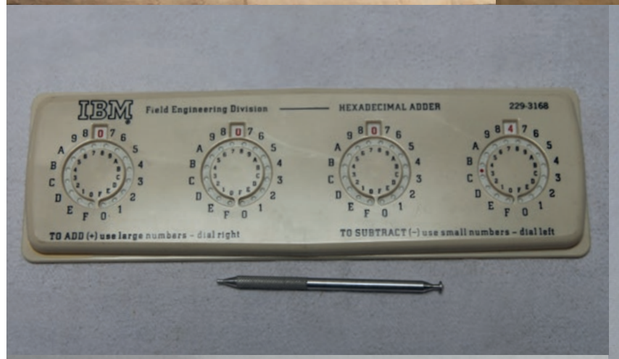
HEXADECIMAL AND OCTAL ARITHMETIC

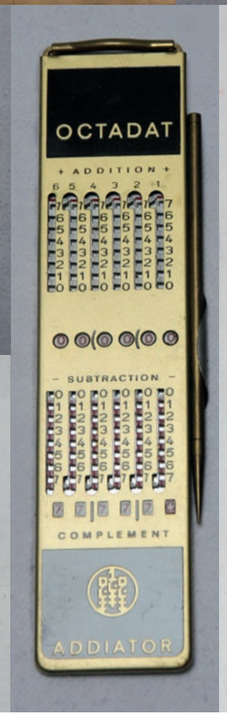
During early development of computers mechanical calculators with Octal and Hexadecimal arithmetic were used as help for debugging. Support for addition and subtraction. All these devices are rare. Holiac (1963) below is a unique device emulating computer's (arithmometer) operation. Arimmetica Locale (binary arithmetic treatise) "Engravings" are from Napier's Raddologia (1623).

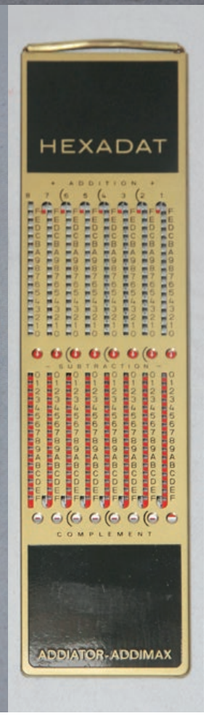


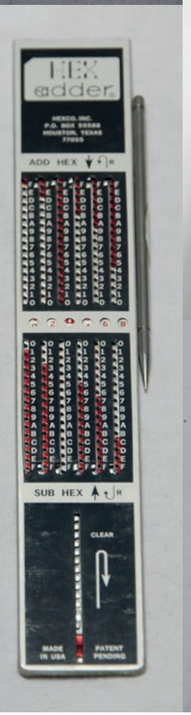






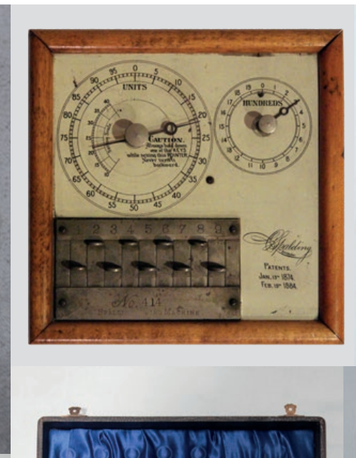






COLUMN ADDERS

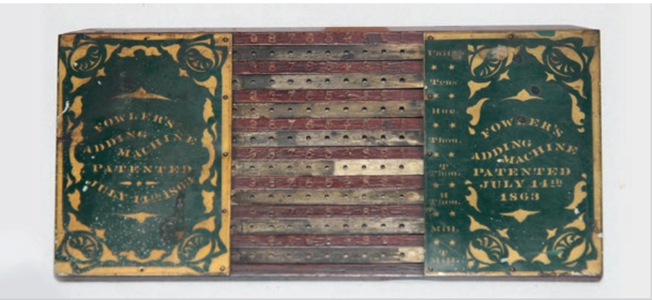
Column adders are designed to add many numbers by columns, the way we do it manually. Spalding (1884), The Adder (1902), Certa (1903), Kuli (1909) and Diera (1906) are very rare. Adix (1903), depending on the model, is either very rare or rare. In Concentric Adders you can also find Beacourt (1912), which is also a column adder.

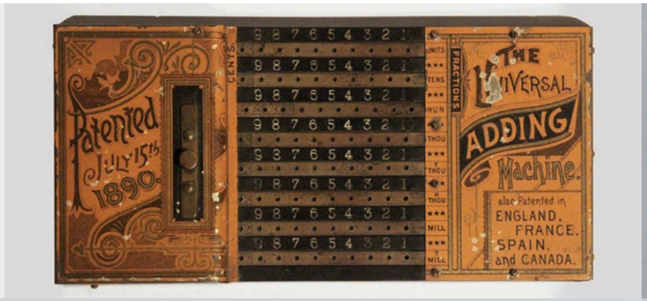


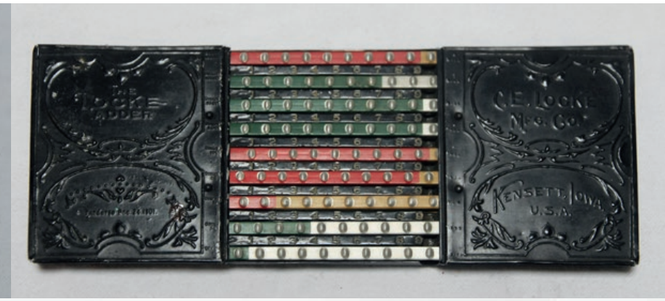
EXHIBITION ROOMS

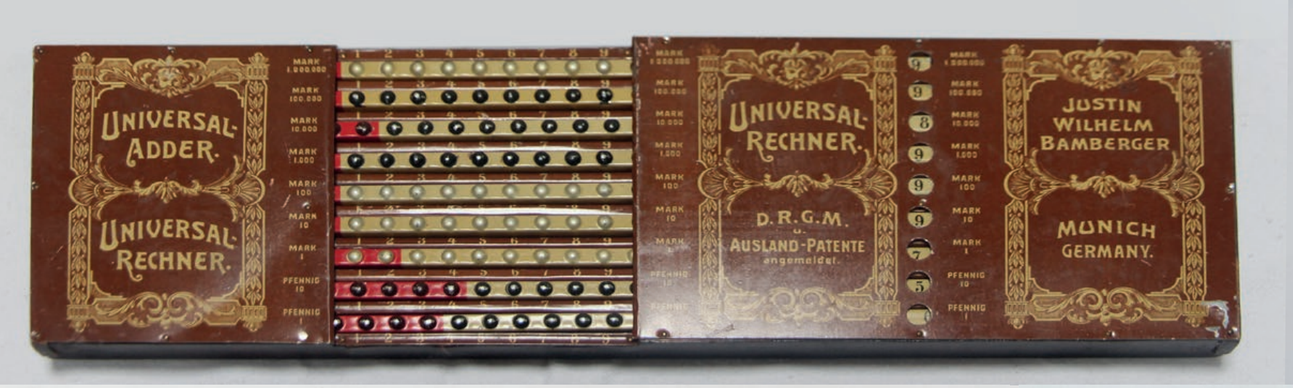
SIMPLE ADDERS

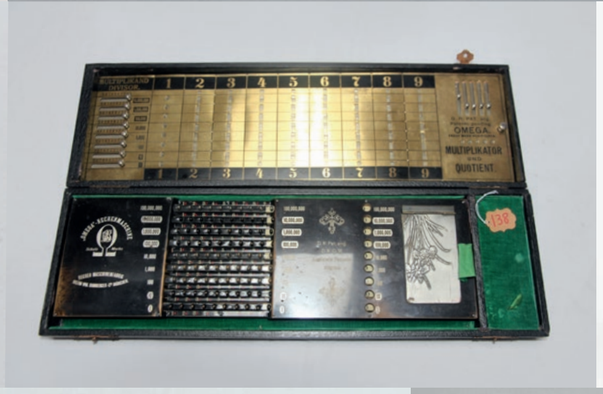
These devices enable multi column adding. Manually "entered" carry. Historical and unique: Young interest calculator (1951) and Dilworth, the first US addiator (1905), and Omega (1905) with British currency Napier's multiplier is the only known Napier multiplier device for British currency. Appelby (1856) is unique. Perfection Adder (1895), Fowlers (1863 and 1890 Universal), Locke (1901), Bamberger (Universal Adder 1903) and decimal Omega (1905) are very rare. Also in this room we can find addiators without Kummer/ Troncet, like carry. Dilworth (1906) is the first US addiator. It is the only one known. Semplix model 1 (1926) and Sascol (both Italian addiators) are rare. These addiators are also shown in other rooms.

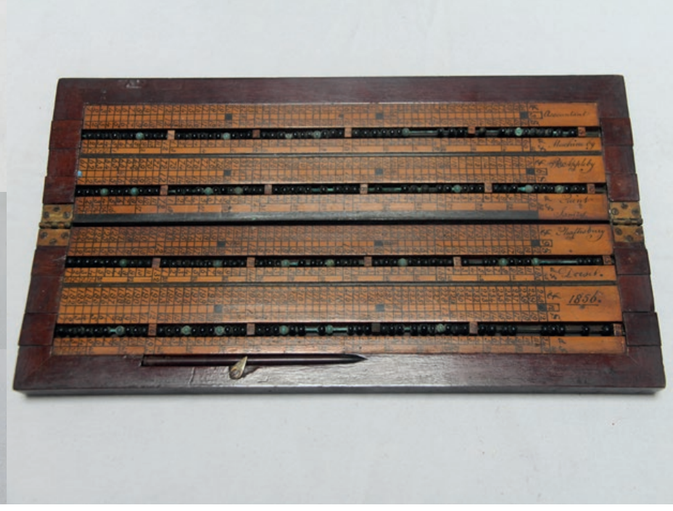


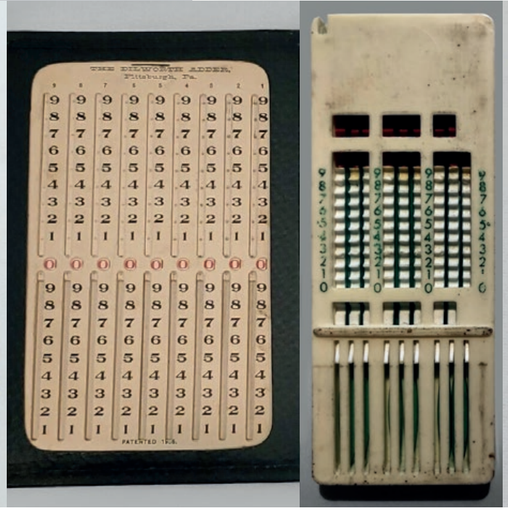








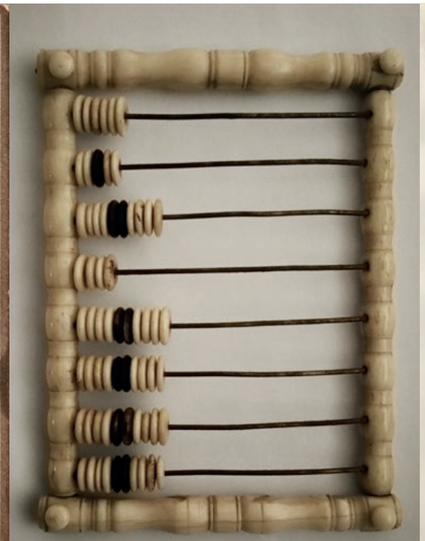


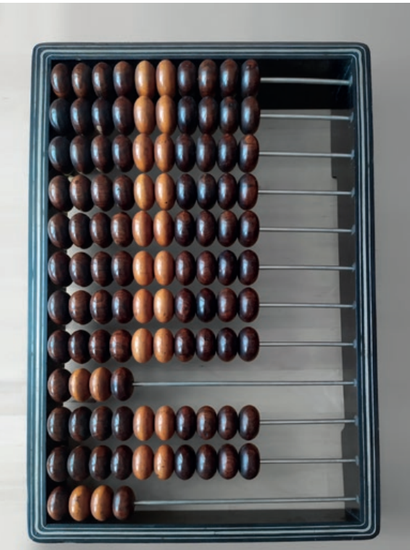


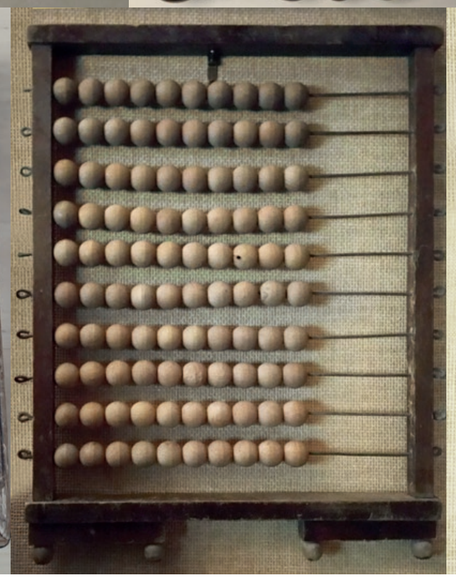
EXHIBITION ROOMS

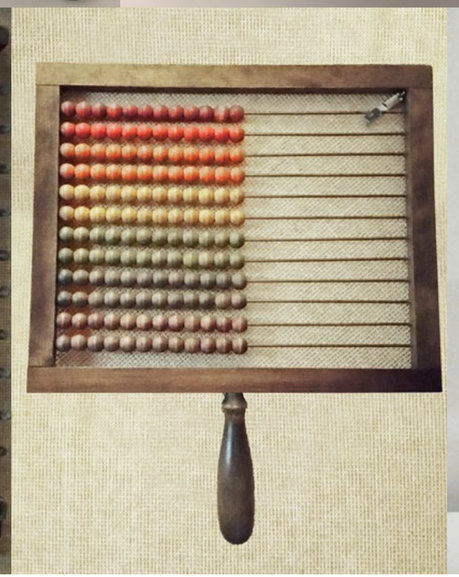
ABACUS

Abacuses are the most ancient adding devices. They survived till today, as they are very simple and intuitive to use and are great for teaching arithmetic. In Japan, till now, there are "abacus" competitions. Using soroban (Japanese type of abacus), competitors can amazingly fast add huge numbers, much faster than we can add them using electronic calculators. Chinese small "coral" abacus (XIX C), Russian small bone abacus (XIX C), German (XIX C?) and Swedish demonstration abacuses are very rare. American abacuses below are rare.









EXHIBITION ROOMS

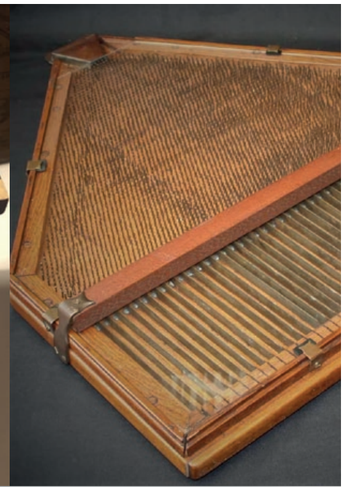
TRONCET / KUMMER TYPE

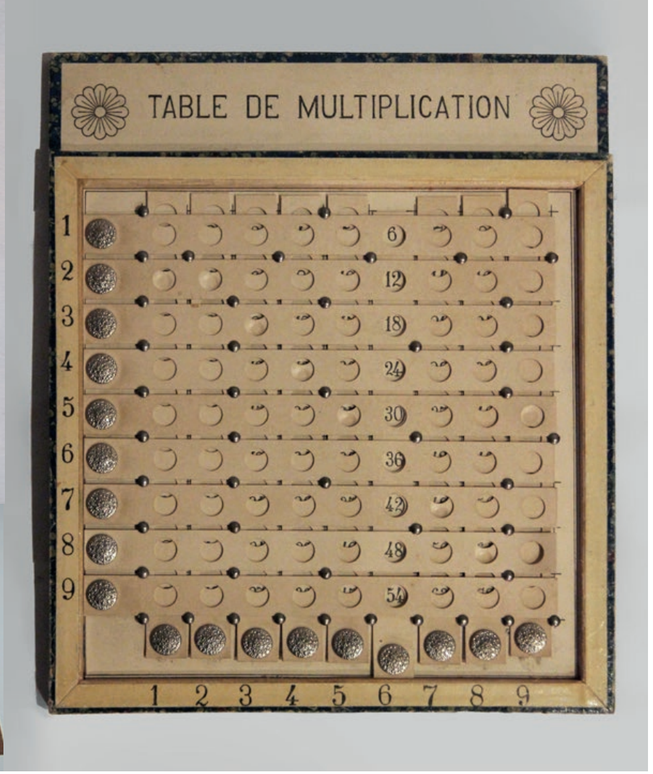
Slonimski (1840) invented a rotary adding device indicating carry and allowing to enforce carry on the next position. Based on his idea for adding device with circular wheels, Kummer (Heinrich Kummer – Computer Timeline (computer-timeline.com)) (1847) invented much simpler and practical Addiator by replacing wheels with a sliding bar and a "hook" to enforce carry. Troncet commercialized Kummer's idea. Troncet adders were sometimes sold with additional multiplying device. Troncet with Genaille multiplying insert (1889?) and Dilworth (the first US addiator (1905)) are unique. Liczydełko is, most likely, unique. Troncet with Napier's multiplier (1907), Totalisateur Troncet (1895), Trick, Octadat – octal adder, Russian "Pocket Arithmometer" (Rebo) are very rare. Hex adders and Kopernik are rare or very rare. Some addiators (Dilworth (1905), Semplix (1926) and Sascol (1954)) do not have a hook to enforce carry, just an indicator that carry needs to be added manually on the next position. Troncet addiators and Dilworth are historical devices. There are more Addiators in the collection that are only listed in Catalog Details.

EXHIBITION ROOMS

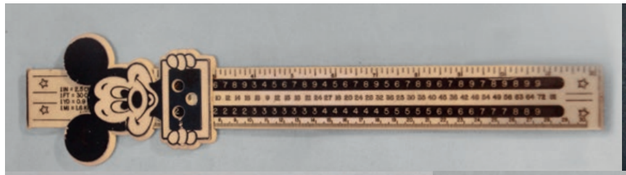
EDUCATIONAL DEVICES

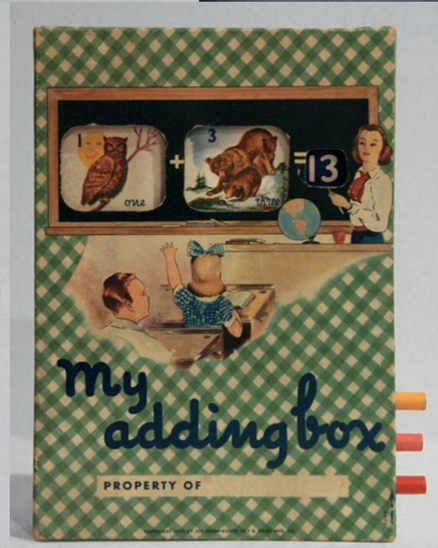
A lot of devices were invented to help students to learn. Many of them are also aesthetically very beautiful. These artifacts were used to teach multiplication tables, adding, fractions etc. In this room we do not show devices which are shown in other rooms (abacuses, demonstration slide rules etc.). Le Grand Disque Chiffré (1860?), Eureka (1889), The Little Accountant (late 1800ies), Fingers (1921), Archimedes ("fractioning" Apples 1930), Table de Multiplication (1910s?), Steinhilber Abacus, Kuhn's Drill Test, Smith and Doller Arithmetical Scales (1880-1890), Badalamenti Factorization Rule (device to find factors of the number), Sonnenschein Arithmometer (1879-1886), Robot Answer Game Machine, Galton Board – statistics teaching device and some other devices are very rare. Most of other devices are very rare or rare.

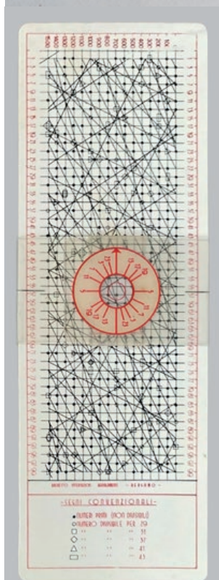


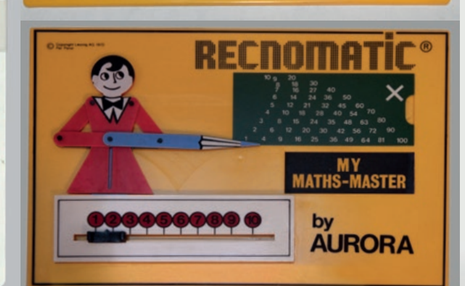


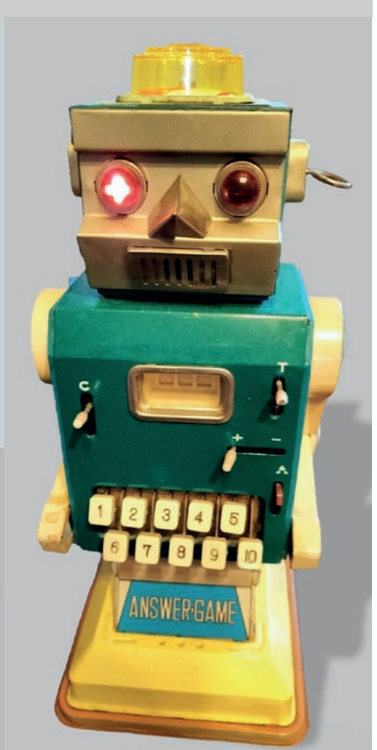
EXHIBITION ROOMS











NAPIER, SLONIMSKI, GENAILLE, ROTH AND OTHER DEVICES

Napier invented a method of doing multiplication using so called Napier's Bones or Napier's Rods. Napier's Bones simplified adding the carryover to the next decimal position. This method was earlier invented by Arabic scholars. One needed to add carry on each position manually/mentally, which made it simpler to add carry, but it still was a source of mistakes. Roth tried to improve it and invented a Roth multiplier, one still needed to add carry mentally, if required. Selig Slonimski invented a machine that eliminated adding mentally, however his machine was complicated to use, as user needed to set the "state" of the next column's position. His invention was based on the mathematical theory that he invented. None of Slonimski's devices survived, Valéry Monnier recreated Slonimski's multiplying device in 2009. Filipowski's device (1860) was created on the basis of Slonimski's theory. There are only two known Filipowski's devices, the second one is in the Science Museum in London. Genaille-Lucas invented a simple graphical method of reading multiplication results directly. Filipowski (1860), Omega with Napier's multiplier in British currency (1905?) and early Napier bones (early XVIII C) are of historical importance. Arithmograph Dubois (1866), Omegas (1905), Genails (1885), Arithmographe Troncet with Genaille and Arithmographe Troncet with Napier multiplying device (1907), "ILO" are very rare. Arithmograph Troncet with Genaille multiplier is unique. Replica of Slonimski's multiplying device made by Valéry Monnier is one of two recreations of Slonimski's multiplying devices made. Multirex-Multor is a device designed for multiplying multiple digit numbers. Engravings are from Raddologia (Napier 1623) and "Theatrum Aritmetico Geometrum" (Leupold 1762).

Napier

Roth

Replica by Valéry Monnier, Multiplicateur et diviseur à réglette dit "prompt multiplicateur et diviseur" in the CNAM collection.

Slonimski Multipliers

Zelig Slonimski invented a method for multiplication where carry was not added (to the next decimal position) but the value on the next positions was enforced by a next state of all possible carryovers (there were only 28 of them). None of his original devices survived. The only (surviving) devices using Slonimski's methodology is Filipowski (1860). There are only two known, another one is in the Science Museum in London. It is possible that some Joffee bars, also based on Slonimski's theorem, survived. Below you can find the replica of Joffee bars by Valéry Monnier. The engraving is from British patent of Slonimski's multiplier (Barnett, 1846).

Genaille-Lucas

Genaille (1885) invented a very interesting device that allowed to see multiplication results by following the graph, like the one below. Lucas (mathematician and popularizer of mathematical games and puzzles) helped him. Troncet, French inventor of Addiators, created a combination of Addiators and a multiplier that he based on the Genaille's idea. Troncet device, and a multiplication form of Genaille multiplier is unique.

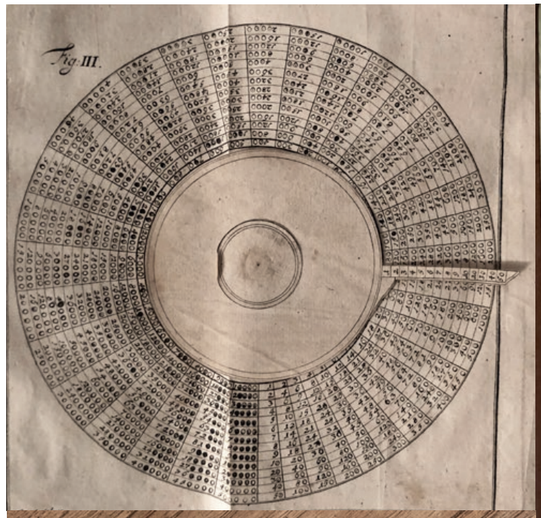
Multirex-Multor

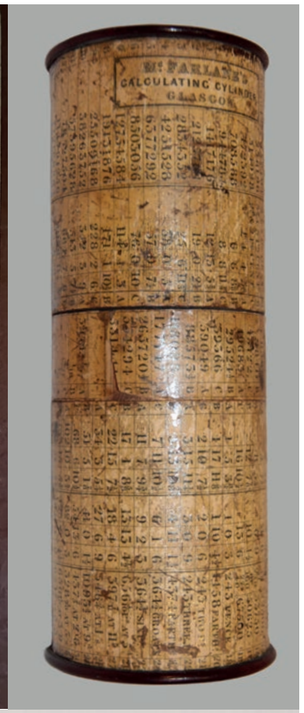
Multirex-Multor – for multiplying multi-digit numbers. The horizontal stripes are bundled on top of each other for each point and carry 1 to 9 times the number on the outside right. By pulling out the horizontal stripes to the right according to the digits of the first product factor, all multiples of its digits are displayed. The multiples appear in the elongated cut-outs of the base plate. Multirex – Calculator Dictionary (rechnerlexikon.de).

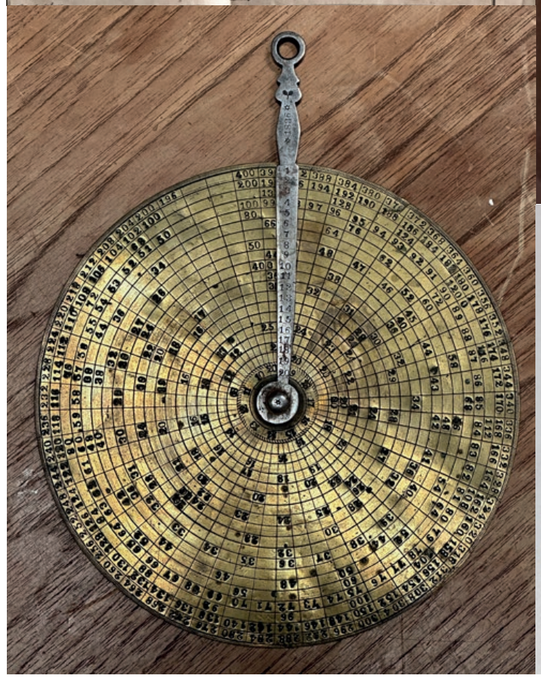
READY RECKONERS

Ready reckoners are devices showing numerical calculations' results in the table. Some ready reckoners are included in other rooms, not in this one. All devices below are either rare or very rare.

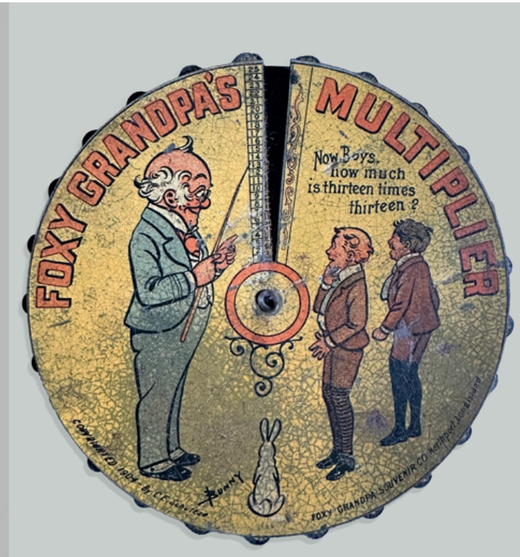
Several XIX C very rare devices. Several early XX C devices are very rare. The engraving is from Leupold's "Theatrum Aritmetico Geometrum" (1762 edition).

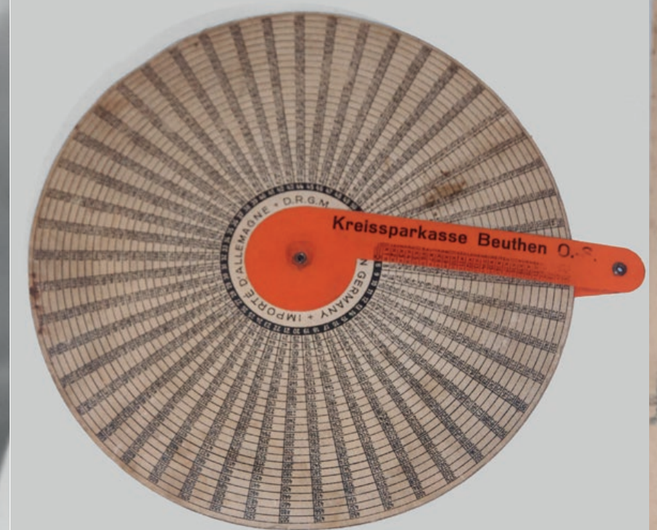






EXHIBITION ROOMS





EXHIBITION ROOMS

ADDING MACHINES – PARALLEL WHEELS

These devices were invented in XIX C. In Smithsonian institution there are several patent models for this type of machines. Chapin (1870) seems to be the first device made, not a patent model. It is the only one known. Fossa-Mancini (1896) is the first commercialized Italian calculating machine. It is very rare. Chapin (1870) and Fossa-Mancini (1896) are historically important. Renea (1930?) is a prototype, never manufactured. Syrius (1912), Lipsiaddi (1914) are very rare. Many other devices are rare.

KEYBOARD ADDING MACHINES

Keyboard machines were the easiest and the fastest devices to operate. Although designed to do additions and subtractions, they could be used for all basic arithmetical operations: "+", "-", "x" and "/". Comptometer manufactured by Felt and Tarren was the first commercially successful adding machine. The company existed (in different forms) for over 100 years. First Comptometer model (1887) is very rare and historically important. Commonwealth (1915) is a very early machine with 10 keys keyboard. It is unique. Other wooden Comptometer (1896), Comptometer A (1904), Burroughs Calculator (1912) are very rare. Several other devices are rare.

Comptometers

Miscellaneous Keyboard Machines

MISCELLANOUS ADDERS

This is both adding and counting device.

STEP DRUM MACHINES (ARITHMOMETERS)

Step drum machines relates to the way calculations are done mechanically. These machines allow to perform four basic arithmetical operations: "+", "-", "x" and "/". Usually, these machines are relatively big and bulky. Thomas de Colmar type machines are called arithmometers. Thomas de Colmar established the first manufacturing of step drum machines (www.arirhmometre.org). Not including two prototypes, from 1822 and 1848, a very small production of his Arithmometers started in 1850 (in France). In 1878 Burkhardt started production of arithmometers in Germany. In 1882 Elliott brothers introduced their arithmometer in UK. Within a few years step drum machines started dominating the industry. This domination lasted till Odhner and Brunsviga popularized Odhner type calculating machines based on a different principle: pinwheel machines. In US keyboard type machines, such as Comptometer and Burroughs, dominated the market. After the WW II Curta introduced his miniature calculators based on a step drum principle.

Thomas de Colmar

There are several historical machines in this "room": one of the first known Thomas arithmometers (serial 164, 1852), one of the first known Burkhardt arithmometers (serial 72, 1878) and one of a few known Elliott Brothers arithmometers (1882, the first British arithmometer). Experimental Thomas arithmometer with multiplier (1880-1890) is unique. It was designed to simplify multiplication. It never went into production. In addition to mentioned above, there are also several very rare arithmometers: 20 digit Thomas (1870), British arithmometers Tates (1882) and Tates-Layton (1903), Burkhardt arithmometers (1878, 1882, 1883), Bunzel (1898?), two Peerless Babies,one of them early (1904?) in a wooden box, Peerless II, Saxonia II (1901) and V, X×X (1906), very rare Unitas (arithmometer with totalizator, 1907), "miniature" Archimedes F Junior (1925), very rare 1918 Millionaire with Totalizator (Millionaire is not a step drum machine, it is a direct multiplication machine (e.g. for multiplication by 7 instead of adding 7 times the number, the number is directly multiplied by 7)), MADAS XI Male, early Curta with pointy shifting pins, early Curta II, rare Monroe executive model with slides. Most of the devices in this category are very rare or rare, Engravings are from Thomas de Colmar's patent publication and early instructions.

British

Swiss

Millionaire and MADAS were made by the same H.W. Egli company in Switzerland. Both machines were highly sophisticated. Millionaires are historical devices. In many ways Millionaire is a unique and a very special type of calculating machine. It is the first successful commercially direct multiplication machine. It requires only one turn of the crank handle to multiply the number entered on the sliders by a multiplier number. This was accomplished by creating a mechanical representation of the multiplication table which could be read and used by the machine. There are two examples of this machine in the collection: one with (model VIII TD, 38 manufactured) and another without totalizer (Model VIII). Creator of Millionaire, Otto Steiger, was only 18 when he invented this machine. A very rare apparatus to set a constant as an entry for calculation for Millionaire is also a part of the collection.
MADAS VII T Malta is rare (450 manufactured), MADAS IX Maxima is very rare (51 manufactured). Both machines can perform automated multiplication and division.

German

Curta

Curta is a miniature four functions (+-/x) calculating machine. It has an extremely compact and elegant design. There were two models: Curta I and Curta II. The most sought for is early model with pointy shifters below.

Brunsviga-10, Monroe

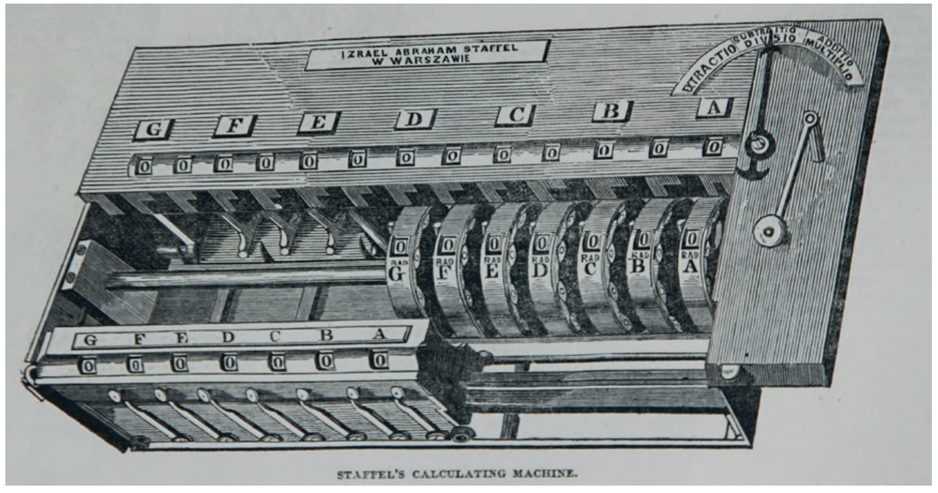
Brunsviga is known for being one of the most important pinwheel machines manufacturers. Brunsviga also developed few models of step drum (divided step drum) machines, from which Brunsviga 10 was the most successful. Monroe was created by Baldwin and Monroe in 1911. There are two historical devices by Baldwin in this collection: lumber measurer patent model (1873) and Baldwin Arithmometer (1874).

Mercedes

Christel Hamann was an exceptional inventor. He invented several calculating devices, each working on a different principle. For Mercedes Euklid he invented a calculating mechanism: proportional level, which allowed for fast operations and was also very reliable. All Euklid machines below, except model 29, are very rare. Model 29 is common. In this collection there are several machines designed by Hamann: Mercedes Euklid (5 machines below), Berolina and Multi-Divo (pinwheel machines), Tricks (addiator), Hamman-Manus A and C switching-latch-wheel calculating mechanism (German Schaltklinke).

PINWHEEL MACHINES

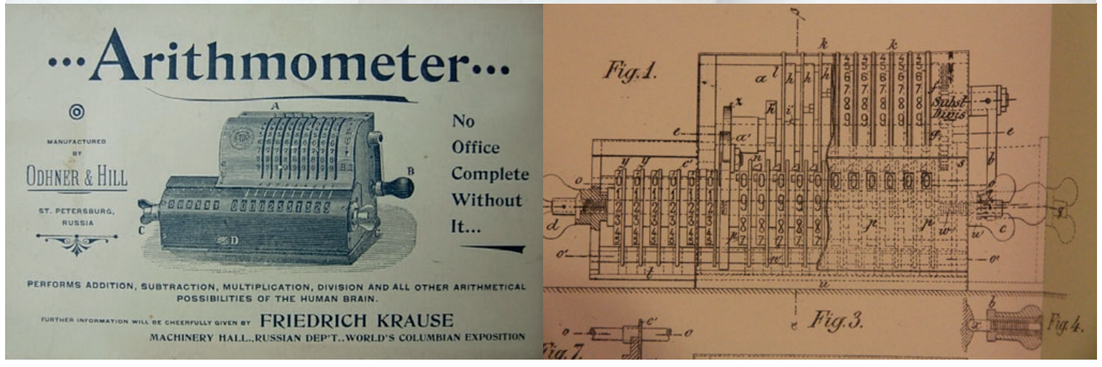
From "Rechenmaschinen" by Ernst Martin: Pinwheel machine is "*frequently called the Odhner machine because Odhner was the first in Europe to employ the pinwheel mechanism in calculating machines. By pinwheel I mean a gear with a variable number of teeth. Odhner may, in fact. have reinvented this mechanism, but this has not been definitely established yet. It should be noted that prior to Odhner, the variable toothed gear had been patented by Frank Stephen Baldwin in America and had been used in devices for a number of years. It seems also to have been known to Leibniz, Poleni and Dr. Roth.*" Staffel machine (1845) was also based on the same principle. Staffel offered his machine to Emperor Alexander II. Odhner, who was living in St. Petersburg, must have learned about it, and designed and built his "Odhner" Arithmometer using the same calculating principle (pinwheel). After building a few prototypes (1877), Odhner redesigned his Arithmometer and started production in 1890. In 1892 he licensed his machines to Brunsviga. In XX C Odhner type machine became the most popular calculating machines in Europe. Pinwheel machines' collection is very rich and important. There are several historical machines, important collections within this collection and very rare calculating machines. Historical machines: five short handle Odhner machines, including 1890 Odhner serial number 21 (the first known machine of this type) and short handle Brunsviga B (1893). There are several unique machines or prototypes, including Brunsviga MG (1924). Very rare machines include 1930 Odhner Tandem (only two more machines known), first manufactured Odhner (duplex) 135, Odhner Arithmos 6 (only one known), small Odhner 9 (only two known), two very rare Odhner Bs and Odhner Cs and other very rare Odhner models, Monopol (1902), Chateaux Brothers – the first known 22 digit (output) Odhner type machine (1909), L'Éclair (1912), Orga (1921), many very rare Brunsvigas and several other machines. Collection of Russian Odhners, early Soviet Odhners and Swedish Odhners are very rich and important. Collections of Brunsvigas, Triumphators and other machines collection is also very rich. Collection of double machines is interesting: Odhner Tandem, 35 and 135, Brunsvigas MDIIs, MDIIRs and Brunsviga 13z/2 Duplex, Thales Geo. Engraving below: Staffel machine from "The Illustrated London News" (special edition accompanying London World Exhibition 1851).



STAFFEL'S CALCULATING MACHINE.

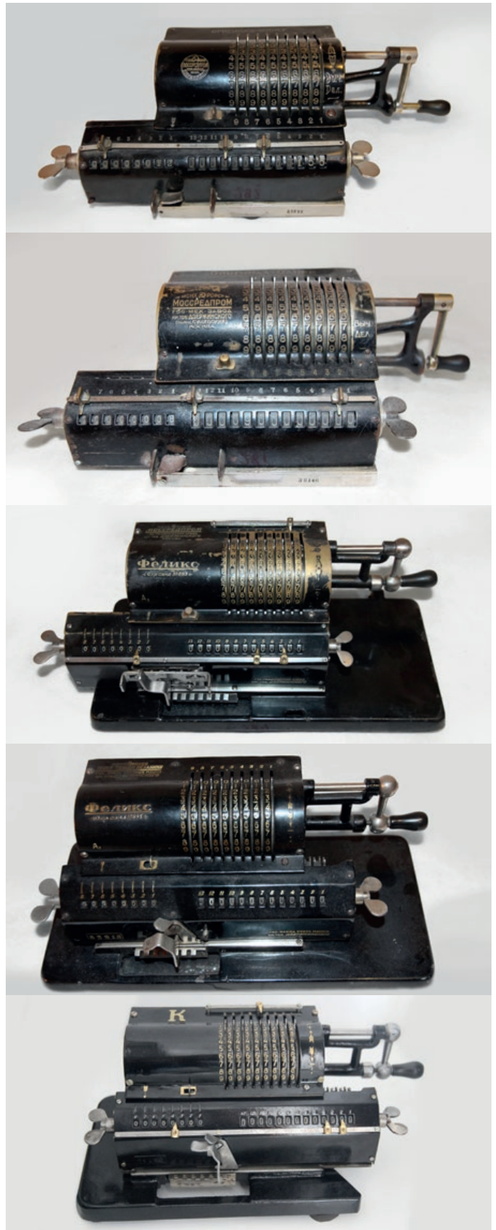
Russian Odhners

Odhner made a small number of prototypes of (Odhner) Arithmometers in 1874. He tried to market them with not much success. Odhner redesigned his Arithmometer and started production in St. Petersburg in 1890. He sold rights for selling and manufacturing in Germany to Brunsviga (1892). It took several years for Odhner type machines to dominate European market. Odhner 21 is the first known production Odhner and it is a father or a mother of all Odhner type machines ever made. There were millions of them. Short handle Odhners are historically important and very rare. Several other Odhners shown below are very rare: Odhners B (15-digit output register) and C (18-digit output register). Odhners with "complications": fast clear of registers and/or advanced carriage shift are either rare or very rare. Odhner 21 is the most important machine in this collection. Engraving below is from Odhner British patent publication (1891).



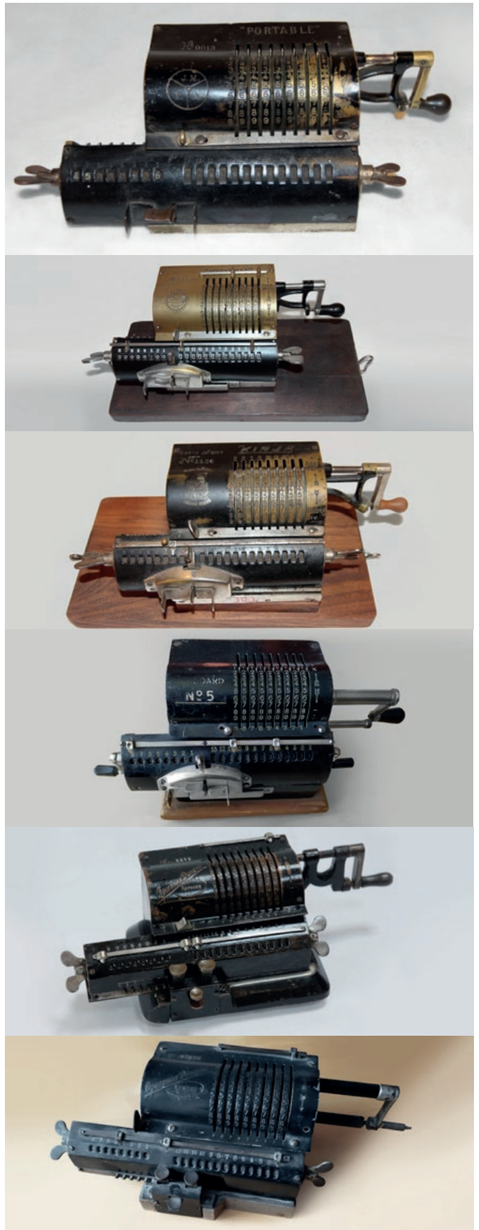
Soviet Odhners

After the revolution the production of Odhners split. Odhner family moved production to Sweden and established its own production there. Soviet authorities moved production of Odhners to Moscow. In a few years (1928) a new smaller machine, "Felix", was introduced and replaced Odhner production in Moscow. Soviet Odhners machines are very rare, early Felix machines are rarely found.



Other Soviet Odhner Type Machines

All these machines are very interesting and very rare. Production was very small. The first "Portable" (serial 13) has a unique logo and a very early "primitive" carriage shift mechanism.

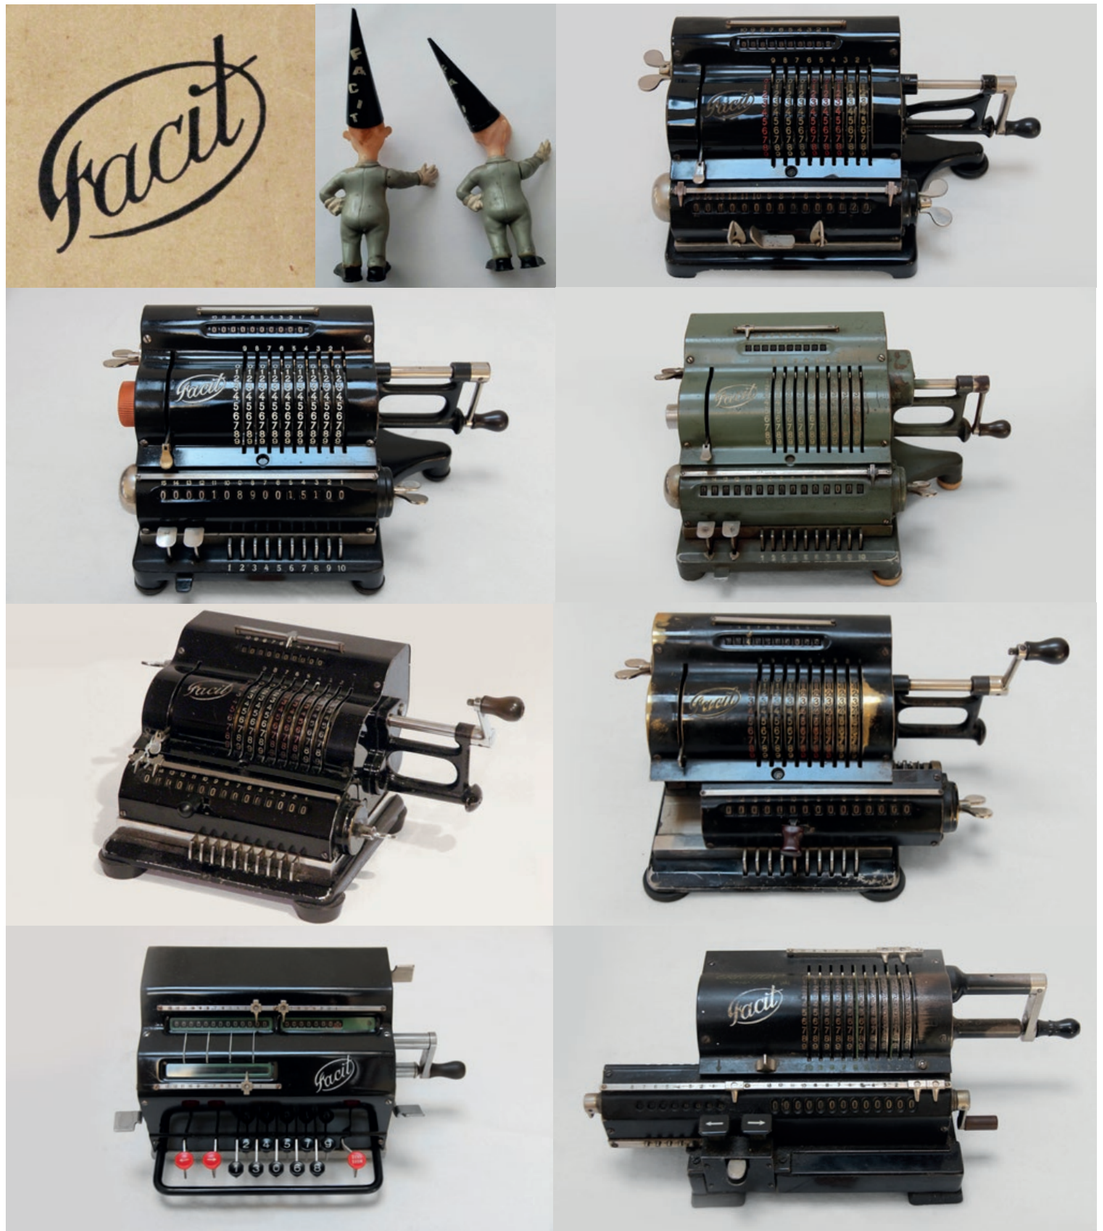


Swedish Odhners

After the Russian revolution Odhner family moved from St. Petersburg to Sweden and established its own production there, continuing the mark Original Odhner. There are several very rare and rare machines in the Swedish Odhner "room". Very rare: small Original Odhner 9 (only one other is known), Arithmos 6 (unique), Original Odhner Lucid (the only Odhner type machine for calculation in British currency), Arithmos 1, 3 and 5, Original Odhner Tandem (only 3 known), Original Odhner 35 and 135 (first Original Odhner 135 manufactured). Rare: several other Odhner models.

Facit

Facit production was established in 1918. In 1932 Facit introduced Facit T, the first keyboard style Odhner type machine. Facit Original with serial 77 is the 2nd known Facit. Facits 10s with push button to change direction of counter register are very rare.



Poland

Facit machines were manufactured under license in 1960s and 70s.

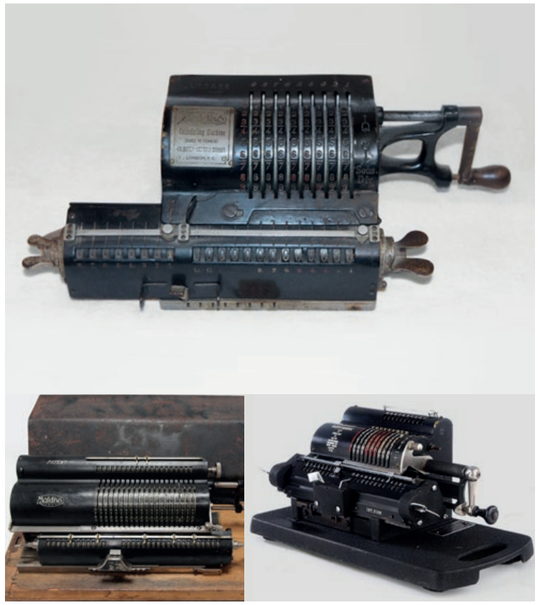
Hungarian Odhner Type – Preciosa

Japan

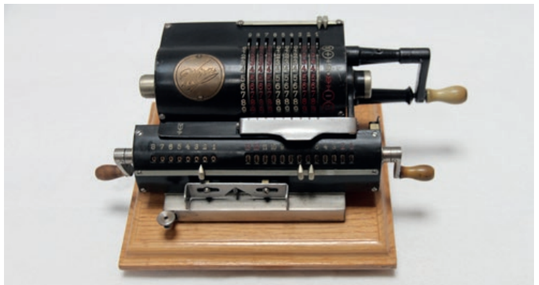
UK

Muldivo – Thales and Chateaux Freres UK import and Britanic

Most of the pinwheel machines sold in UK were imported. Muldivo was importing Chateaux Brothers from France and Thales from Germany. Odhner (see Swedish Odhners) made a British currency model (Lucid). There was a relatively small production of Britanic machines. Two Muldivo machines below are very rare: one of the first sold under Muldivo name and a very rare Thales GE sold as Muldivo.



Czechoslovakia

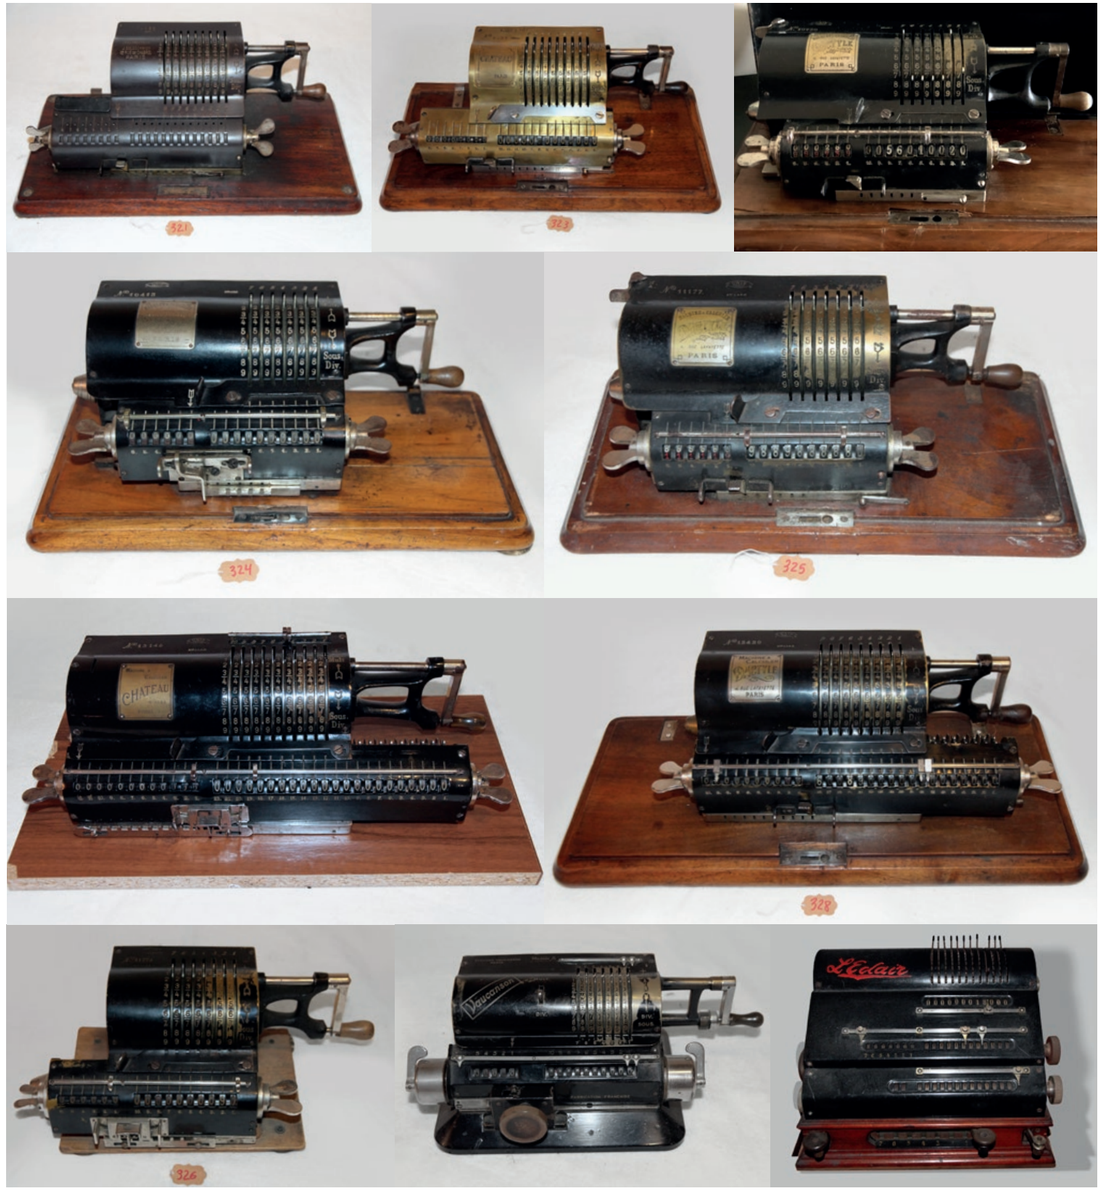


US

US had a small production of pinwheel machines. Marchant started production in 1911, later Arrow (1921) and Rapid Calculator (1923) were introduced. Marchant Model A is very rare, with 1911 patent only, Rapid Calculator serial 103 is also very rare, possibly the oldest surviving. Arrow Calculator production never took off, only a few survived.

France

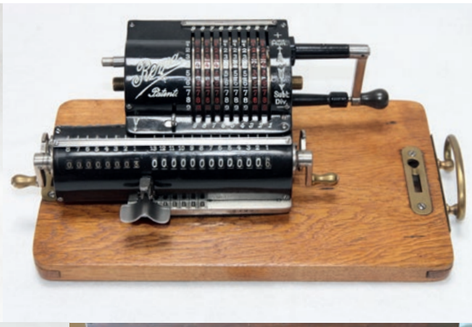
In France there were few manufacturers of Odhner type machines. Chateaux Brothers were manufacturing Odhner type machines under different brand names: Goldsmidt (very rare), Chateaux and Dactyle since 1905. 22-digit Chateaux is a historical machines: it is unique and it is the earliest known Odhner type machine with such capacity (2 digits more than contemporary computers). Small models are very rare, 18 digit models are also very rare. Muldivo was importing Chateaux Brothers machines to UK and sold them under the brand Muldivo. L'éclair is a huge and a beautiful machine. It is very rare and sought after. Vaucasson model A is the first model manufactured by Vaucasson. It is very rare.

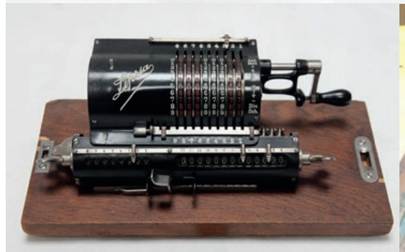


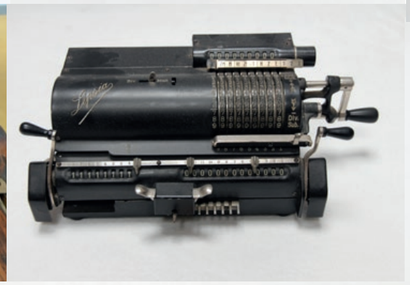
EXHIBITION ROOMS

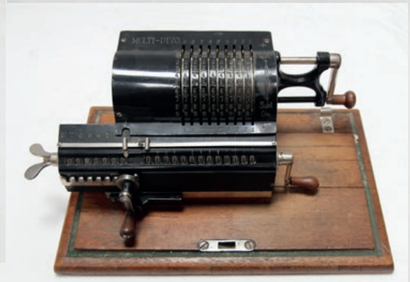
German Pinwheel Machines

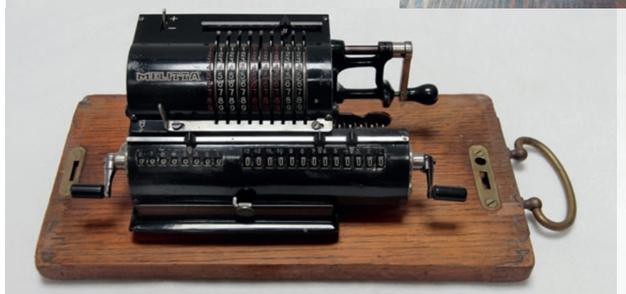
The biggest and the most diversified production of Odhner type machines was in Germany. There were several manufacturers of these machines: Brunsviga, Triumphator, Thales, Walther, Melitta, Berolina, Orga, Hannovera, Monopol, Monos, Demos, Rema, Lipsia. There are several rare and very rare Odhner type machines in the collection. There are two Hamann-Manus calculating machines in this section, including very rare Hamman-Manus model A. These are not pinwheel machines, externally they look like it. Hamann was one of the most creative designers of calculating devices. In the collection there are several more devices designed by him (Mercedes Euklid, Berolina, Multi-Divo, Tricks).

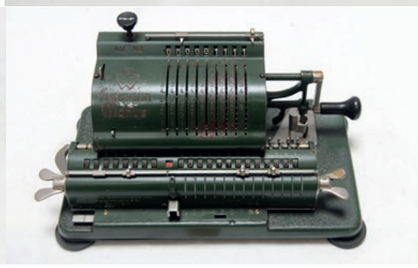












EXHIBITION ROOMS

Brunsviga Germany

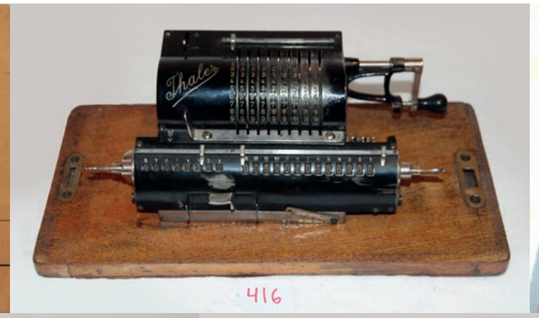
Brunsviga licensed Odhner machines (1892) and introduced pinwheel machines to Germany. It was one of the most successful manufacturers of the calculating machines. The collection includes a very rare short handle Brunsviga B (historical machine), short handle Brunsviga C, Brunsviga MG prototype that never went into production, very rare Nova I, precursor of the Nova line, and many very rare and important machines.

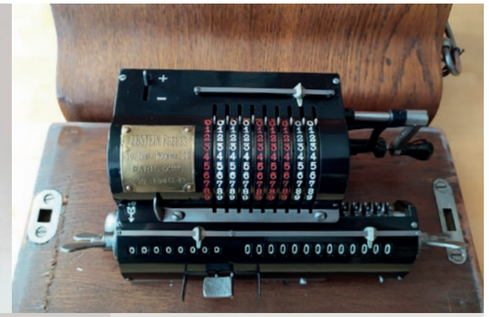
Triumphator

Triumphator (1905) introduced using a carry in the counter register. Initially Odhner type machines had a counter register with digits red and white, red to indicate a carry on the next position. With time all manufacturers of pinwheel machines were selling machines with counter register using carry. There are several very rare and early Triumphators below. Some later devices are unique and/or very rare.

Thales

Thales was another important manufacturer of calculating machines. There are a few early Thales machines and a very rare double machine – Thales Geo. Another very rare machine is a 20-digit Thales GE sold in UK under the name Muldivo.

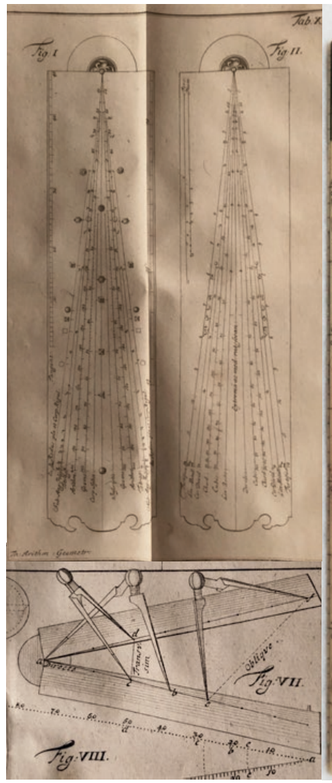




SECTORS

Wikipedia: *The sector, also known as a proportional compass or military compass, was a major calculating instrument in use from the end of the sixteenth century until the nineteenth century. It is an instrument consisting of two rulers of equal length joined by a hinge. A number of scales are inscribed upon the instrument which facilitate various mathematical calculations. It was used for solving problems in proportion, multiplication and division, geometry, and trigonometry, and for computing various mathematical functions, such as square roots and cube roots. Its several scales permitted easy and direct solutions of problems in gunnery, surveying and navigation. The sector derives its name from the fourth proposition of the sixth book of Euclid, where it is demonstrated that similar triangles have their like sides proportional. Some sectors also incorporated a quadrant, and sometimes a clamp at the end of one leg which allowed the device to be used as a gunner's quadrant. Sectors were devices used in navigation.*

Very rare: Bion's (early XVIII C) regular size and a small 11 cm sector, Canivet (mid XVIII C). Engraving from Leopold's Theatrum Aritmetico Geometrum (1762)



SLIDE RULES

Wikipedia: *The slide rule is a mechanical analog computer, which is used primarily for multiplication and division, and for functions such as exponents, roots, logarithms, and trigonometry. It is not typically designed for addition or subtraction, which is usually performed using other methods. Maximum accuracy for standard linear slide rules is about three decimal significant digits, while scientific notation is used to keep track of the order of magnitude of results.*

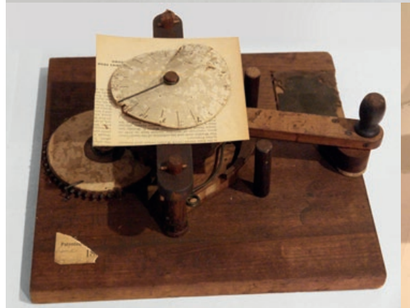
Historical slide rules: the first demonstration slide rule (Gravet et Lenoir (1850-1860)), the first American demonstration slide rule (K&E 4061(?) (1900?)). Very rare devices: Russian brass Gunter scale (XVIII or early XIX C), Sliding Gunter (~1800), Sibley's (1930) set of connected slide rules to create graphs allowing estimation of results of several calculations, Loga 15 meter rule with additional drums with handwritten scales, important XIX C circular slide rules such as Boucher, Calculigraphe HC (1878), Charpentier Calcumeter (1882), other rare or very rare rules such as Paisley, Lafay model 2, Richardson, Palmer's Pocket Scale, 2/83 N Faber-Castell slide rule regarded by many as a finest slide rule ever made. Engraving from Leopold's Theatrum Aritmetico Geometrum (1762).

WATCHES

HP-1 (1977), Juvenia (1945).

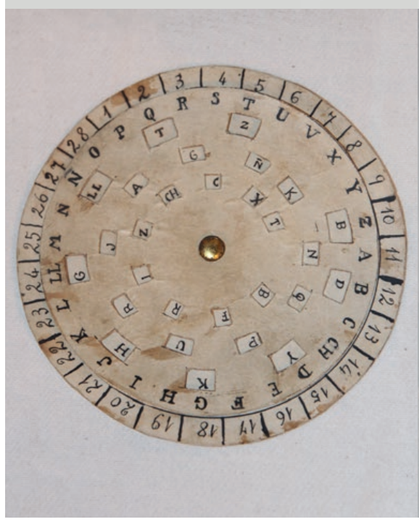
PATENT MODELS

Patent models were required by the US Patent Office with each patent application up to 1880. Each patent model is therefore unique. A device looking like a clock is probably a patent model for a column adder for adding and subtracting. The inventor of this device is unknown. There are a few patent models below: Baldwin lumber measurer (1873), Bill's adder (1878), Enright Game Register (1863), Woodrow and Henderson Stamp Cancelling and Registering device (1882), Powell's Ballot box (with a counter of ballots) (1879), an unknown adding device and a fractions adding device (prototype?, patent model?). Baldwin lumber measurer, which automatically calculated 4 different types of lumber, gave Baldwin the idea of creating calculating machines.



CRYPTOGRAPHIC DEVICES

Collection of cryptographic devices is very small. Very rare and interesting are Le Sphinx (1930) and Transporteur a code secret (1912), both by Georges Lugagne.



EXHIBITION ROOMS

MISCELLANEOUS

This group of devices is put together because either device does not fit in any other room, or I was not sure where to put it. There are a lot of interesting devices, not necessarily calculating, e.g., Campylograph (1903) a unique device to draw patterns, 80 cm diameter and 8 kg computer disk platter with capacity of 1.5 MB (1960s), 1850s Maurel's alarm clocks (Maurel invented Arithmaurel calculating machine), XIX C figural puzzle, Jallais's Machine à Lire (1923) which Umberto Eco described as one of the most fascinating devices he saw. Other very rare calculating devices in this room are Kalkylator (1915) for special purpose computations, wage calculator by Defiance Machine Company (1906), device for some special (multiplication or factoring) calculations (1836), Matematicsche Brieftasche mit Ingenieur-Messknecht (1860), Bathrico Calculating Bank. Graphics. Engraving – "Machine Pour Tirer Les Lotteries" (Lottery Drawing Machine (Random Number Generator), 1709) from "Machines et Inventions Approuvees" Gallon, vol 2 (1735).

GALTON BOARD
Germany (?), Early 1900s
**
very rare
WS-779

The Galton board, also known as a quincunx or bean machine, is a device for statistical experiments named after English scientist Sir Francis Galton. It consists of an upright board with evenly spaced nails (or pegs) driven into its upper half, where the nails are arranged in staggered order, and a lower half divided into a number of evenly-spaced rectangular slots. The front of the device is covered with a glass cover to allow viewing of both nails and slots. In the middle of the upper edge, there is a funnel into which balls can be poured, where the diameter of the balls must be much smaller than the distance between the nails.
The funnel is located precisely above the central nail of the second row so that each ball, if perfectly centered, would fall vertically and directly onto the uppermost point of this nail's surface (Kozlov and Mitrofanova 2002).
Galton board – Wikipedia.

MULTIPLYING DEVICES

Napier Devices

NAPIER BONES / RODS
UK (?), 1700s early Early XVIII C, Late XVII C (?)
*****
very rare
8 × 8 × 1
WS-173

Very rare model/example.
Missing one piece.
Unusual set up of numbers on the top to indicate columns on each side of the rod. The 2nd row indicates actual number (column) multiplied. Valéry Monnier told me, according to Stephen Weiss, this type of set up found in early literature on Napier bones. A "standard" set of rods (see below) shows only the actual column. The one on the other side of the rod is always a 9 complement, i.e. for number 4 it is 5 (= 9-4).

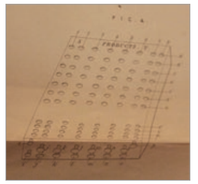
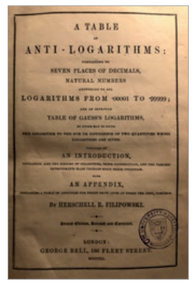
Slonimski Multipliers



SLONIMSKI'S BASED MULTIPLYING DEVICE
France, 1844-Replica (2009)
very rare, only two made
70 × 52 × 13
WS-650

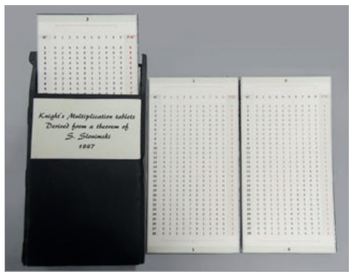
No need to mentally add carry (like in Napier Bones) and Roth above Chaim Zelig Slonimski – Computer Timeline (computer-timeline.com)
SloniMultE (loria.fr) SloniMultE (mechrech.info).
Recreation of Slonimski multiplying device by Valéry Monnier.
None of the Slonimski's devices survived.
Valéry made two of these devices.
Rechenmaschinen-Illustrated (rechenmaschinen-illustrated.com).

Slonimski Multipliers



HERSCHELL FILIPOWSKI'S CALCULATING MACHINE FOR MULTIPLICATION AND DIVISION
UK, 1860
****
very rare
14 × 12 × 8
WS-180

Based on Slonimski's patent: carryover state of all possible carryover outcomes.
Herschell Filipowski (computer-timeline).
Herschell Filipowski – Wikipedia JoffeFilipowski.pdf (mechrech.info).
Two devices are known to exist. Another is in the Science Museum in London.
Also Filipowski's book with tables of Anti-logarithms.



KNIGHTS TABLES
France, 1848-Replica (Knight's book) (this device 2010ies)
*
very rare, remake
№
1
22 × 13 × 7
WS-651

Made by Valéry Monnier, original Knights tables were published by Henry Knight in 1847. Tables were based on the Slonimski's theorem KnightTablets1847 (mechrech.info).

JAFFE BARS
Poland/Ukraine, 1881-Replica 2010 remake made by Valéry
***
very rare, remake
№
19 × 28 × 39
WS-652

Remake by Valéry Monnier JoffeFilipowski.pdf (mechrech.info) SloniMultE (mechrech.info) There are no known surviving Joffee bars.
Example for multiplying 274 by any number between 1 and 9. Number on the bottom next rod "number", on the top rod "number". E.g. 274 × 7 = 1918.
From jewishencyclopedia.com: "*Zebi Hirsch Jaffe: In 1877 Jaffe published in "Ha-Zefirah" (No. 24) his first mathematical article, and since that time he has contributed many mathematical and Talmudic articles to that periodical and to "Ha-Asif." In 1881 Jaffe went to Moscow, where he exhibited his calculating-machine, which won him honorary mention by the administration of the exhibition.*"
Ha-Zefira was a Hebrew science magazine created by Slonimski, for which Slonimski was initially a main contributor.

**
very rare, possibly one of the kind. This is an unknown, till now, variety of Genaille-Lucas multiplication device.
№
9 × 9
2,25
19 × 13.5 × .5
WS-150

Arithmograph Troncet with Multiplier
The interesting part is an attempt to use Genaille-Lucas adding methodology with the disadvantage of manually adding carry. As one had to add carry, ("1" to the left (if present) needs to be added to the next position. The process was very cumbersome, and it was easy to make mistake. In a sample to the right number 45678 is multiplied by any digit. Let's assume by 9. We create a number in reverse order: 2 (next) 0 (next) 1 (0+1) (next) 1 (0+1) (next) 1 (0+1) (next) 4 (3+1). Now we need to reverse order of 201114 -> 411,102
Also listed with Troncet/ Kummer type devices.

Multirex-Multor

MULTIREX-MULTOR (AUSTRIA)
Austria, Beginning of XX C.
Date unknown
very rare

Suisse Machines – Millionaire (Direct Multiplication Device) and Suisse Arithmometers

Ernst Martin "Calculating Machines": *The Millionaire machine is to be regarded as a proper multiplication machine in that it solves problems of multiplication directly on the basis of the multiplication table, whereas other types of calculating machines are only adding machines and, as such, carry out multiplication by a continued series of additions (exceptions are the machine by Ballée, of which only a very few were ever produced, the Moon-Hopkins machine, and the Kuhrt U.S. machine). (Subtractions and divisions may be regarded as additions and multiplications in a negative sense; therefore, we shall not make any special mention of them from this point on.) It is obvious that a multiplication machine that only employs the multiplier digit I corresponds to a pure adding machine.*

PINWHEEL MACHINES

Russian Odhners

АРИФМОМЕТР
СИСТЕМЫ-В.Т ОДНЕР
Short handle model. Serial 21
Russia, 1890
*****
21
9 × 6 × 11
12,25
23 × 15 × 12
WS-267

The first known manufactured Odhner. Except prototypes in NMAH (Smithsonian Institution in DC) and Polytechnical Museum (Moscow), this is a "mother" (or maybe an older brother) of all these types of machines.
Odhner Arithmometer | Smithsonian Institution (si.edu).
Previously the oldest known was 50 in catalogue from 1910. 52 from Tekniske Museet in Stockholm was regarded as the oldest surviving one. Arithmometer letters above from tellia.com.
Odhner with serial 21 is the first known production machine of this type. It is historically very important machine. Original Odhner instructions are very rare. There are several very rare Odhners and rare early Soviet machines in the collection.

Russia, 1890
*****
very rare
313
9 × 6 × 11
23 × 14 × 12
WS-763

Odhner A. Short handle model. 9 × 6 × 11 is very rare.
From Timo Leipala:
Odhner 313 is depicted without any background information in Odhner booklets "Från Abacus till Odhner", 1958 "Vom Abakus zur Odhner", 1961 "From the Abacus to the Odhner", 1961 and maybe in some other Odhner publications, where the serial cannot be read. Evidently the calculator belonged to Odhner company.
Odhner taxonomy: Original Odhner – Rechnerlexikon. There is no agreed convention for naming different Odhner models. They were sold as a base model (A, B or C) with different features. Based solely on some sketchy advertising in the link above different machines are mapped. This mapping should be regarded as guidance, not an authoritative way to categorize Russian Odhner machines. On the right a page from Arithmometer Instructions "Arytmometry Odhnera" by G. Gerlach. Arithmometers are depicted by No 230-235, where each model corresponds to specific features.

scarce (?)

61 × 4

WS-694

No markings of maker (please note another device has the same 428 identifier).

SLIDING GUNTER

UK, ~1800

very rare

63 × 6

WS-433

Navigation slide rule, c.1800. | Science Museum Group Collection Similar device in Tessaract catalogue Winter 2021/2022: *English, c. 1800. This uncommon slide rule is made of boxwood, brassbound, with a 26-1/4" (67 cm) long central slider. Rule and slider are divided on both sides with logarithmic and trigonometric scales, including Chords… In 1807 Mackay wrote, in The Complete Navigator, "But the most convenient form of this instrument [the "common Gunter's scale"] both for accuracy and dispatch is that known by the name of the SLIDING GUNTER, in which the use of a compass is superseded."*

GRAVET ET LENOIR

France, 1850-1860 (?)

*****

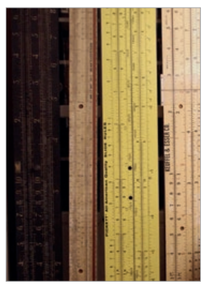
very rare, most likely only one known.

15 KG (?)

220 × 22 × 5.5

WS-695

This is the first known demonstration/ teaching slide rule.
It is made from ebony (?), with inlaid scales made from brass.



5 DEMONSTRATION SLIDE RULES

France, G&L 1850s-60
US, K&E and Picket -1900

*****

scarce (?) / rare

WS-696

G&L very rare, most likely the only one. The first demonstration side rule that survived (made).
K&E 4061(?) very rare, the first US demonstration slide rule.
Pickets and another K&E 100
Two unique slide rules (on the left) are historically important: Gravet & Lenoir (G&L) from 1850-1860 – the first demonstration slide rule ever made and K&E 4061(?) – the first US demonstration slide rule.
G&L is probably the only one that survived.
K&E is very rare.
The other 3 rules are two Pickets and K&E.
In Order: G&L – dual duplex – ?, K&E – 4061 – ?, "Big" Pickett – ?, "Little" Picket – ?, K&E – model 100.

Drawing by my daughter Helena Szrek, 11 years old.

CELEBRATING WALTER SZREK: *A LIFE FULL OF COLLECTIONS, CONNECTIONS, AND CURIOSITY*

Born in 1951 in post-World War II Poland, Walter Szrek – named Wlodzimierz and called Wlodek at home – was the son of Jewish parents, Emil Szrek and Maria Walach. Both his parents were Holocaust survivors, determined to build a brighter future for their children, and they did just that. They created a close-knit family with their sons, Wlodek and Lolek, and friends who had survived the war and lost their relatives. For Wlodek, their hard work and family focus were the core values that shaped his existence and carried into his family life with his wife Irena and their three daughters Helena, Asia, and Monika.

Walter's journey through life was a vibrant mosaic of personal achievements, strong friendships, close family bonds and love of travel and exploration. A brilliant thinker and software engineer, thanks to his education at Politechnika Warszawska (Warsaw University of Technology), he set off for the USA in 1979 with his wife Irena, and their young daughters Helena and Asia. Once in the US, Wlodek, now called Walter, became a principal system architect and developer in the lottery business startup that quickly rose to the top of the industry in the '80s and '90s. His groundbreaking contributions became many of the de-facto standards still used in the lottery world today. After 24 years at GTECH, he and Irena founded Szrek2Solutions, revolutionizing the lottery industry with their Trusted Draw random number generation solution.

Wlodek was an avid collector with a flair for the eclectic, starting from Polish posters to beer-bottle openers, white advertising figures (like Michelin men), and finally, calculating machines. His fascination with mechanical calculators turned into an internationally recognized collection of over seven hundred devices, artifacts, and publications. Wlodek co-created a major reference website, Rechenmaschinen-Illustrated (https://www.rechenmaschinen-illustrated.com/), and a personal site dedicated to his calculator collection (https://calculators.szrek.com/).

Often on Sunday mornings, Walter was up early and heading to a flea market or antique store, "on the hunt." He enjoyed the pursuit at least as much as the catch. In 1999, Walter and Irena moved for a few years back to Poland, with their youngest daughter Monika, to be close to their elderly parents. At Warsaw's antique flea market, "Kolo," Wlodek's fascination with artifacts, WW2 memorabilia, Jewish cartoons, and calculating devices grew. In 2000 when he bought a Russian (Original) Odhner "A" from 1907, he officially caught a new collecting bug. Over time, he found more of these machines at Kolo and other antique fairs. He was fascinated by the devices' inventors, their ingenuity and the history surrounding them. And so, his collection grew. He formed a relationship with Tadeusz Kabzinski, an old-school craftsman in Warsaw's Praga, who would repair the machines he found, restoring them to working order. Mr. Kabzinski's affection for the devices was contagious, while restoring the machines he shared his fascination with them with Walter.

Over the years, the collection kept growing. There was an unspoken agreement between him and Irena that they would not discuss the purchasing details, and Walter would discretely find a space for them in their home. Over time, the shelves became a multi-layered labyrinth of machines, as books were evicted, and more devices moved in. Imagine a compilation of mechanical calculating devices that started small, like a modest toybox. Over time, it grew and evolved, sprouting new adders and multipliers, pinwheel machines, like a little boy's hunt finding more toys. This treasure trove didn't just sit around gathering dust; it has been an ever-expanding showcase of creativity and problem-solving. You would experience an abacus showing off its beads, a slide rule flexing its logarithms, a calculating machine shining its logo, introducing yet another carry method. Each device has brought its own gift, demonstrating a unique way to tackle mathematical challenges as if the collection itself were alive and eager to teach.

In 2010, Wlodek was working in Vienna, Austria when the volcano in Iceland voided the skies of aircraft across Europe. Unable to return home to Rhode Island, USA, he headed to Poland by train, stopping off in Krakow. He visited Collegium Maius Museum, located in Kraków's Old Town in the Jagiellonian University's oldest building, dating back to the 14th century, housing ancient scientific instruments. Walter was interested in seeing their collection and met the Museum's curator, Ewa Wyka, forming a friendship that lasted for many years. Wlodek shared with Ewa a common enthusiasm for the artifacts and discovery of their provenance, and he returned to Krakow with Irena several times to visit.

By 2018, Walter decided it was time to create a catalog of the collection. Over two weeks, each of 600 machines was documented, photographed, measured, and weighed, and returned to the shelf with a catalog number. This was a laborious task taken on by Asia and her husband Hal. The catalog grew, with thousands of hours spent adding details as Walter continued to learn more about the machines and their history. As the treasure trove grew, new entries were added, … and so on.

When Walter learned of his cancer, his zest for collecting didn't wane. He would forget about his health problems when he was researching and sharing information about the machines with other collectors and friends, or on the prowl for new ones. His catalog has transformed from a Word document into a professional printed catalog. In his final months, Walter decided to donate the collection to the Collegium Maius, who were enthusiastic in receiving the collection to carry it on, safeguard and exhibit it in the Museum and University's Math Department where it could also serve for teaching purposes. Walter was grateful that they valued the opportunity to take on the curation of the collection and happy to know it would continue to educate and inspire all those who would see it in the years to come.

In his last weeks, Walter didn't have much energy, yet he found the strength to share his knowledge and fascination of the collection with family and friends, spending hours on video calls from his bed. What a gift he offered to the world, of creative exploration, mathematical genius, love, and service.

Rechenmaschinen-Illustrated (rechenmaschinen-illustrated.com)	Based on Ernst Martin's "The Calculating Machines (Die Rechenmaschinen)" book – great website created by Herbert Schneemann (1941-2014) with my help. Creating Rechenmaschinen-Illustrated.com was the greatest calculating "thing" for me. The website motivated Herbert and me to learn more and better it. It also allowed to share the world of calculating devices and machines with others.
www.arithmometre.org	Valéry Monnier's website about arithmometers. My favorite calculating place.
Arithmetical machines and instruments, 19th century (ami19.org)	My other favorite calculating place. Valéry's website on devices from XIX C. Includes Malassis collection. La collection Malassis (ami19.org) The best collection of calculating devices gathered by a private collector.
Schneemann's Webpage (schneemann.de)	Herbert's website of his calculating devices.
Computer Timeline – Yet another site for bright people, crafted by Georgi Dalakov (computer-timeline.com) Sitemap – Computer Timeline (computer-timeline.com)	Georgi's Dalakov history of computing devices. Very rich, well researched, informative. His other website History Computer – The History of Computing (history-computer.com) History-computer.com is now sold. Only old direct links are working (not sure for how long). Computer Timeline is a great site. To navigate directly to specific inventors, use sitemap.
Hauptseite – Rechnerlexikon (rechnerlexikon.de/wiki.php)	Wiki of the calculating devices.
Calculating Machines | National Museum of American History (si.edu) Calculating Machines | Smithsonian Institution (si.edu) Adders | Smithsonian Institution (si.edu)	Smithsonian Institution, fantastic collection. They show their collection on the Web with very good pictures' quality and interesting description of devices.
Calculating instruments, napier's bones – antiques calculating instruments (calculatinginstruments.com)	Very rich and a beautiful collection of Antonio Perez.
Beitraege Geschichte mechanisches Rechnen (mechrech.info)	Publications and other "things" by Stephen Weiss. Besides very interesting and important articles, one will find computer animations of very interesting mechanical devices.
www.boelter.rechnerlexikon.de	Learn there about restauration. Detlev helped many people with their machines.
Historische Rechenmaschinen und Schreibmaschinen (ifhb.de)	IFHB website. They compiled a very comprehensive catalogue of calculating devices. One can also download a Brunsviga collection catalogue. Brunsviga had a fantastic collection. Majority of their collection is now in the Landes Museum in Brunsweig (Braunschweigisches Landesmuseum).
Rechnen einst (uni-bonn.de)	Arithmeum – The only museum totally devoted to collecting these devices, promoting education and actively trying to enhance their collection. They show very limited, although very interesting, highlights of their collection on the web.
Sammlung und Galerie historischer Rechenhilfen, Rechengeräte, Addiermaschinen und RecJust a beautiful collection, henmaschinen – rechnen-ohne-strom – historische Rechenhilfen (rechnen-ohne-strom.de)	A beautiful collection of different calculating devices.
Polish Contributions to Computing (fgcu.edu) polishcomputing.org	Two websites about Polish inventors of calculating devices by Janusz Zalewski.
Introduction Calculators (beuth-hochschule.de)	Great to learn how these machines work.
John Wolff's Web Museum – Calculator Technical Section (johnwolff.id.au/calculators/Tech/TechIndex.htm)	Mechanism description, manuals, rebuild instructions.
Mechanical Calculators, Mechanische Rechenmaschinen, Mechanische rekenmachines (w-hasselo.nl)	Explanation how these devices work.
Cris' site on antique mechanical four-species calculators (crisvandevel.de)	Beautiful collection of calculators, especially Odhner type. The most interesting: fascinating detailed explanation of restauration of different machines. Cris' site on antique mechanical four-species calculators (crisvandevel.de) page shows how to pack calculators for shipping.
Things that Count – A collection of things that count (meta-studies.net)	Very informative description of the computing throughout history illustrated by the devices collected by Calculant (Jim Falk).
Addiator Catalogue – MechaniCalculator (mechanicalculator.com/addiator-catalogue/)	Very comprehensive documentation on addiators compiled by Kees Nagtegaal.
Klassifizierung mechanischer Rechenmaschinen – Rechnerlexikon (rechnerlexikon.de/artikel/Klassifizierung_mechanischer_Rechenmaschinen)	Very interesting classification for the calculating machines by Peter Haertel.
www.calculators.szrek.com	My original website with my calculating devices, last time updated in June 2004.
Museums	Arithmeum (Bonn), Deutsches Museum (Munich), CNAM (Paris), Science Museum (London), NMAH (Smithsonian Institution Washington DC), Polytechnical Museum (Moscow), Tekniska Museet (Stockholm), Braunschweigisches Landesmuseum (Braunschweig), Muzeum of Jagiellonian University (Cracow).
Personal correspondence with Valéry Monnier, Herbert Schneemann, Timo Leipälä, various articles by Martin Reese, and many other authors.	Valéry is an expert on Arithmometers, abacuses, counters, adders etc. Herbert did a very solid and interesting research about all devices he put in rechenmaschinen-illustrated.com, Timo is a renowned researcher and expert on pinwheel machines (Odhner and others), Russian and Swedish devices and many other calculating things. Martin Reese wrote book and many interesting articles on calculating devices. He is an editor of Historishe Buerowelt, IFHB magazine.

The Walter Szrek Collection: *A Human Adventure*

A Collection is not a collection of heterogeneous objects, it is the fruit of a long quest, it is an Art. If it can be born from our natural curiosity, it is patiently built and accompanies us throughout our lives.

Collecting is always about rediscovering a little bit of your childhood. In this treasure hunt, there is the excitement of the found object, and the almost immediate need to discover another. Yet it's with our "adult hat" that we operate! Knowledge is the mother of all discovery, along with luck, intuition, and perseverance. It was in this spirit that I met Walter, and that may be the greatest treasure of all! We are collecting to bring light to a part of our history and to preserve it as much as possible for future generations.

A collection must be seen in its holistic dimension: the object is inseparable from its history, and from this rediscovery its beauty is born. We both have a great thirst for knowledge, and the search for "truth" is a powerful driver. We are sometimes criticized for being materialistic and for getting too attached to objects. But this is not the case, because our ultimate quest, more than to possess, is to restore the lost humanity to these inert objects, and as such guarantee them eternity.

In this philosophical reflection, the questioning of our own eternity arises. Time passes, and lives disappear. We leave behind our energy of love, and everything it has touched becomes eternal.

The collector is a pilgrim in the abyss.

Valéry Monnier
